Rysdyk's Hambletonian was then standing at $500, and was considered by many as the greatest sire of the day. The stallion record was held by his son, Jay Gould, 2:21½, and George Wilkes was but a half second slower. Having examined both these stallions, as well as others, Mr. Wilson induced the Simmons Bros. to put George Wilkes in his charge for the following season in Kentucky. The Preston place, near Lexington, was selected as the site of their farm, was rapidly improved, and made ready for business under the name of Ashland Park. Here in the autumn George Wilkes was brought with his trotting mate the chestnut stallion, Honest Allen. As a team these stallions had three times made a record of 2:28, and had never been beaten. Alone George Wilkes had a harness record of 2:22, and Honest Allen of 2:33½. George Wilkes to wagon had made 2:25, and Honest Allen, with running mate, had more than once passed under the wire in 2:19. Their original stallion bill, issued early in 1873, lies before me, and after recounting two score of their victories, alone and together, says of George Wilkes: "He has stood but two seasons for mares, which was in 1868 and 1872. He sired the brown filly, Tansy, winner of the Wilkes' three-year-old colt stakes. She was broken in August, 1871, trotted a mile in October over Fleetwood Park in 2:39, and has been repeatedly timed quarters in thirty-seven seconds, being three years old. Also the Watts' colt which trotted in 2:40 at the same age; Lady Wilkes, who has a public record of 2:37 at five years old, and Young Fillingham, who lapped Fleetwood out in 2:35¾ at Point Breeze Park, Philadelphia." Honest Allen's list of produce is as follows: "Lady Farnham, who trotted at Providence when five years old in 2:28; Violetta, at six years old, over half-mile track at Boston in 2:32; Lady Carter and the Fisherville mare, either of which can beat 2:30, and Prince Allen, who trotted at Worcester, Mass., in public in 2:38." The season fee for George Wilkes was $100, and for Honest Allen $75. At these figures George Wilkes served eighty-two mares, and Honest Allen forty-four, including those belonging to Ashland Park.

During this year, W. H. Wilson, by earnest effort succeeded in effecting the organization of the Kentucky Trotting Horse Breeders' Association. His letter-book for that time gives some indication of the amount of energy he put into this valuable institution. He began on August 11, had a meeting of invited horsemen on September 14, and yet gave a good trotting meeting that autumn.

In 1874, having dissolved partnership with Simmons Bros., W. H. Wilson removed to Cynthiana. That winter he bought the land where he soon after built the stock farm, Abdallah Park, with which he has since been identified. It is by the bringing of George Wilkes into Kentucky that he best served the horse interests of the state and the country. But he was always eager to raise the status of the trotter, both by the better breeding, booting and care of the animal and by the improvement of trotting law and morals. The seventeen years since he established Abdallah Park have been years of hard work, and in many instances of great disappointment. Had he been possessed of large means he would have owned many more great horses than he has possessed, but it is our pride as it was his, that his enterprise here has paid, and has had to pay, from the beginning. His only capital was himself, his energy, and his unwearied application.

For a little time he intended to carry on the breeding of thoroughbreds in conjunction with his other affairs, and in 1875 went to England and Egypt, whence he imported a well-bred and fine young stallion, Cobham, and an Arabian, Ibn Mosk. Cobham died on the voyage to America, and imported Ashstead was purchased to fill his place. However, this plan was abandoned, and the thoroughbreds dispersed.

Abdallah Park, our home, has ever since engrossed his attention. He had here during the first few years Goldsmith's Abdallah, 2:30, and his brother, John Bright (sons of Volunteer), Pacing Abdallah (son of Abdallah, 1), Nephew, 2:36 (recently owned by Senator Stanford), Col. Wilkes and others, who, like those above mentioned, have sired some speed,

Digitized by Google

although not at that time known at all. In 1878, 1879 and 1880, Smuggler, champion stallion of the world, was at the head of the stud here. Indianapolis, 2:21; Jubilee Lambert, 2:25; Byerly Abdallah; Arnold; Ravenswood; Long Branch—all sires of speed—have been here at different times.

In 1883, Simmons, then four years old, took the chief place at Abdallah Park, which he still holds. He made a record of 2:28 as a trotter, and has sired New York Central, six years old, record 2:15½, made this year. He has twenty-three others to his credit which have not yet shown so well. Sultan, 2:24, was purchased in 1886, and made his first public season here. His success is well known. These two are the most prominent stallions now owned here, although my father has owned and developed scores of trotters and pacers of more or less merit. Of those he himself bred the fastest pacer is Budd Doble, 2:13½, and the fastest trotter is the champion four-year-old stallion, McKinney, 2:12½. The first 2:30 trotter he bred was Mambrino Kate, 2:24 (foaled in 1869, died here this spring). Of the others we have no complete list, but since establishing this farm he has bred:

New York Central	2:15½
Simmocolon	2:19
Coralloid	2:19¼
Whitefoot	2:22¾
Indigo	2:23¼
Orinoco	2:23½
Mambrino Kate	2:24
Lady Thompson	2:26½
Ophir	2:26½
Senator Updegraff	2:27½
Black Storm	2:27¼
Raymon	2:27¼
Moonstone (2)	2:28½
Amurath	2:28½
Gossiper	2:29½
Jubilee de Jarnette	2:29¾
Holstein	2:29¾

He has owned so many trotters and either bred or owned so many sires and dams of trotters that he and I found it impossible to make a list of these even approximately correct, for our catalogue of last winter.

My father was very careful with regard to the pedigrees of his horses, investigating even widely accepted pedigrees as far back as possible. His earliest books and letters show the value which he set upon the family of the dam, and upon very careful description and history as a means of identification. He was an excellent manager of trotting meetings, and a good starting judge, being strict in the enforcement of rules and careful not to discriminate for or against any horse.

In writing of one so lately lost, so passionately mourned, it is not of the horseman that we think most, although his family always were acquainted with his affairs and proud of his successes. We think of him as the husband and father, who, in his rare moments of leisure found his pleasure with us, and who made great sacrifices to give us the education thought best for each. He was a man of generous heart, and I have known by accident of many cases of his aid to needy ones, especially fatherless children. He gave substantial help to many a young man beginning in the breeding of trotters. He was very hospitable, never happier than when his long table was crowded with friends.

He had great physical courage and activity, and a quiet heroism that we did not, I fear, appreciate till that last terrible week, when he lay for five days with neither food nor drink of any sort, and yet talking to us, with his old, gay manner and cheerful voice. He would not acknowledge hunger, thirst or pain, although the sunken cheek, the furrowed brow, the knotting muscles, showed the suffering that his love wished to hide from us. He made plans for our future, and the conducting of the business after his death with wonderful calmness.

He had fallen ill at Fort Wayne, Ind., July 6, and was removed to Cincinnati in the night, Saturday, July 9. The physicians diagnosed the case as cancer of the bowels, and decided to resort to the operation of laparotomy. This was performed in the afternoon of Wednesday, July 13. He rested well that night, talking often then and next morning with his wife and sons-in-law. At 9 in the morning of Thursday, July 14, the wound was dressed, and from this he did not rally. At 10 o'clock he died.

After his death, a more thorough search for the cause was made. A large seed—that of a plum or peach—had lodged in the bowel, and it was this that had caused him so much pain during the last two years, and finally his death.

His will leaves his property, real and personal, to his wife, who is also executrix during her lifetime. After her death it is to be equally divided between his two daughters, Mrs. R. B. James and Mrs. H. K. McAdams. It was his particular wish that the business of Abdallah Park be continued exactly as before, and that his horses should remain on the turf this summer. LAURIE WILSON JAMES.

Notes and News.

STEPHEN W. SMITH, of Padelfords, N. Y., a man who has paid considerable attention to the blood lines of various families of trotters, and whose information regarding the Clays has been given to the readers of this journal, writes in regard to the Royal George family:

"This is a much more valuable tribe of trotters than many people are willing to admit. Royal George became distinguished through force of circumstances. A man named Dougherty, who was buying cattle in the western part of Canada, came to the barn of a man named Frank Munger to look at a blind stallion that was noted for his speed as a roadster. Dougherty took a notion to the horse and purchased him. The stallion could then outfoot any horse in St. Catherines. He was soon matched to trot on the ice, and was never defeated. Munger often drove him seventy-

Digitized by Google

five miles a day, and on one occasion traveled 100 miles with him in the same period. Raised in the wilds of Canada, and with nothing but common farm mares bred to him, this blind stallion founded a family that should be appreciated for all time. The parentage of this horse traces back to a black stallion called Tippoo, foaled about 1820 in western Canada. It has been claimed that Tippoo was sired by Ogden's Messenger, a son of Imported Messenger. Tippoo sired Black Warrior about 1832 out of a dark bay or black mare owned by a British officer. This mare was nearly sixteen hands high, strongly made in every point, and right here the Royal George family inherited the stamina its members are noted for. The mare by her breeding implanted in the family the blood of the English thoroughbred, and Black Warrior resembled his dam very much. A Mr. Billington, of Middlebury, Vt., brought a dark bay mare to Canada, sired by Vermont or Harris' Hambletonian. She was bred to Black Warrior, and the produce was Royal George, the fountain head from whence sprang the remarkable family which bears his name. He was a dark bay, the same color as his dam, and owed much of his trotting qualities to this daughter of Harris' Hambletonian. The breeding of the dam of Old Royal George has been given as unknown by most writers, but there is no doubt that she was a high-bred trotting mare. Royal George sired Toronto Chief, 2:24¼; he in turn got Thomas Jefferson, 2:23, that won a $10,000 stallion race at Buffalo in 1874, and another for the same amount at Boston in 1875. Thomas Jefferson was an all-day trotter, and at Buffalo five heats were required to finish his race. In 1871 he trotted with George Wilkes for the stallion championship, and won, Wilkes taking the second and third heats, and Jefferson the first, fourth and fifth. In his career on the turf Thomas Jefferson won $47,000, a larger sum than was ever placed to the credit of any other stallion by reason of his earnings on the turf. Jefferson was one of the handsomest horses in the world when in his prime. Many of the best general-purpose horses owned in this part of New York (Ontario county) have some of the stout Royal George blood in their veins, and one writer says there was never owned in Erie county, N. Y., anything that could compare with the Royal George's as general-purpose horses. Fields' Royal George, once owned at Buffalo, was a very fast trotter in his day. He also had a temper that would bear watching. I have a slight scar on one of my hands which was caused by getting it too near his mouth at the Palmyra race track many years ago. The horse's driver, young Fields, had finished a heat and stepped from his sulky. The horse turned and started to run. Another person and myself caught him, and he returned the compliment by catching me. They always led him to the track and hitched him to the sulky while walking up and down the home-stretch. I believe his dam was thoroughbred. The second dam of Belle Hamlin has Royal George blood. Alvin, the Canadian stallion with a record better than 2:15, has a good deal of Royal George blood, and there are many other notable members of the 2:30 list with some of this stout strain in their veins.

THE well known stallion Administrator, No. 357, died on the 9th inst. at Margate, P. E. I. This trotting sire was foaled in 1863, so that he was twenty-nine years old at his death. He was bred by Mr. E. Wolseley, of New York state, and afterward kept several years in Kentucky. In 1887 he was taken to Summerside, by Mr. J. A. Gourlie, who, with others, bought him, and he remained there till last spring, when he was sold to Mr. John Marks, of Margate. According to last Year Book he has nine trotters in the '30 list, while he has sired six sons who have nine to their credit, and ten dams which have each produced a trotter that has entered the charmed circle. There are several fine colts sired by Administrator owned in and about this city.

THE California stallion, McKinney, that took the champion four-year-old mark of 2:12½ last season, was recently kicked by a mare, and is quite lame.

THE old trotter, Illinois Egbert, that after being presumably outclassed for a couple of seasons, came out last year and reduced his record to 2:20; won a heat in 2:16½ at Pittsburg, Pa., July 20th.

THE dam of New York Central, 2:15¼, died recently at the Hobart farm in California. She was by Mambrino Boy; dam by Alcalde.

IT is reported that Mr. Hamlin will start his mare Nightingale, 2:18¼, for the two-mile record this season, and as Allerton is also on the same lay some pretty good performances at that distance may be looked for.

THE stallion Aaron Wright, a brother to Delmarch, 2:11½, is being trained at Kiowa, Kas., but it is not yet reported that he has shown much speed.

Digitized by Google

SILVER BOW, a son of Robert McGregor, that beat 2:30 as a three-year-old in 1890, and reduced his mark to 2:22 last season, recently trotted a match at Ogden, Utah, against Thornless, 2:15¾, and went one of the miles in 2:17.

WHEN Leopard Rose, that made a record of 2:15½ as a green horse in 1890, wound up that season with an ailing leg it was announced that she would be retired from the turf one season and bred to Acolyte, 2:21, after which her trotting career would be resumed. Some people who have had experience with broken-down trotters and found that not one in a hundred of them ever goes a good race after a leg once gives way, surmised that Leopard Rose would not do as much trotting as her owner imagined. She was bred to Acolyte according to program, and this season was taken up and jogged, with a view of preparing her for some races later on. It appears, however, that her game leg is already troubling the mare, and she has been thrown out of training and shipped to a veterinary establishment at Toledo, Ohio.

THE old Beacon Park track at Boston has been sold to the Boston & Albany railroad, and will be used for the purposes of that corporation, so that, as a trotting track, it will no longer exist.

THE Allen farm, at Pittsfield, Mass., recently lost, while giving birth to a foal by Lord Russell, the valuable mare Syene, sister to Sable Wilkes, 2:18, as a three-year-old.

THE pacer Sorrel Frank, 2:24½, a son of Nutwood, ran away at Portland, Ore., July 5, and on being stopped fell dead.

NIGHTINGALE, winner of the $8,000 stake at Detroit, was purchased about a year ago by the four men who now own her, and cost $2,700 at that time.

CUCKOO, a son of the trotter Ambassador, 2:21¼, recently paced a mile in 2:19¼.

KEOKEE, 2:20½, is to be bred to Simmocolon, 2:19.

THE old trotter Midnight, 2:18½, has been given a rest for the balance of his days by his owner, Mr. J. D. Rockefeller.

SILVER STREET, a daughter of Nelson, 2:10, recently made a race record of 2:33¾ in Maine, and will undoubtedly beat 2:30 the first time she is asked to do so over a mile track.

BELLE HASTINGS, the dam of Belle F., 2:15¼, has a foal by Pilot Medium that is gray in color, being the first of ten foals from the same dam whose color was anything but bay.

ONLY five sons of Hambletonian, each of whom has twenty-five or more standard performers to his credit, are alive, they being Strathmore, Egbert, Dictator, Harold and Aberdeen. Other living sons of Hambletonian that have ten or more in the list are Jay Gould, Sweepstakes, Masterlode, Victor Bismarck, Messenger Duroc, Echo, Cuyler, Dauntless, Hambletonian Prince and Volunteer.

THE *Turf, Field and Farm* revives the old story about Dexter being a son of Harry Clay by the following: "Conversing a few days ago with two gentlemen, Dexter, 2:17¼, was mentioned, and I was surprised to hear one of them declare, and the other support him, that he did not believe that the ex-king of the turf was sired by Hambletonian. 'I believe,' said the first, 'that the facts are these: Jonathan Hawkins bred Clara to Hambletonian, and another mare to Harry Clay, the same year. Clara's foal died, and as she was a good milker and the other mare a poor one, the colt by Harry Clay was taken from its dam and given to Clara. This was Dexter, and I do not believe that he was ever sired by Hambletonian, or that Clara was his dam. You know that in all the affidavits Mr. Hawkins made on the subject of Dexter's breeding he never said that Clara foaled him, but always that she raised him, which she did.'"

GERHARDT LANG, the well-known Buffalo, N. Y., brewer, and breeder of trotting horses, died recently, but his horse-breeding operations will be carried on by his son.

JAY-EYE-SEE, 2:10, will make his debut as a pacer at the Independence meeting.

CHARLES DERBY, record 2:20, trotting, and that was recently put to pacing, has gone a mile the new gait in 2:28.

INSTANT has won nine races this season and reduced her record five seconds, it now being 2:17½.

THE Hambletonian stallion, Sweepstakes, that is twenty-five years old, made a season of forty mares this year.

JESSIE GAINES, 2:15¾, has been put to trotting again, the attempt to make a pacer of her being a failure.

THE trotter, Flutter, that recently took a record of 2:26¾ down East, is bred way up according to those who are all in favor of developed sires and dams, she being by Epaulet,

Digitized by Google

2:19: dam Buzz Medium, 2:20¼, by Happy Medium, 2:32½, as a four-year-old back in the days when that was a great performance. Epaulet, the sire of Flutter, is a son of the Hambletonian stallion, Auditor, and had it not been for senseless overdriving by his negro handler would never have gone blind. As he is out of a mare by Princeps, and took a mark of 2:19 under unfavorable circumstances, it will be seen that Epaulet is all right so far as breeding and performances are concerned. Buzz Medium, the dam of Flutter, was, like most of her family, none too strong at the finish of a heat trotted about as well as she wanted to go, but she will be a welcome addition to the already creditably long list of mares by Happy Medium that have produced standard speed. Epaulet now has two trotters in the list, both, by the way, out of Happy Medium mares, so that the cross is evidently a good one, combining, as it does, two direct lines to Hambletonian, with Mambrino Chief blood on one side through Princeps, the racehorse blood on the other through the dam of Happy Medium, the old-time long-distance trotter, Princess, whose mile record was 2:30. As Epaulet is only twelve years old and was never given the slightest opportunity in the stud until he was six, it is evident that, like most of the stallions which trot fast, he is also capable of imparting speed, especially when mated with mares of any breeding. The day has gone by when any one will argue that, in the case of some stallions of merit, it doesn't make much difference whether or no they have good mares. Because Blue Bull, for instance, was great under circumstances that would have absolutely buried any except an equine wonder, it does not follow that he would not have been far greater had he been so situated as to have had access to as good mares as fell to the lot of some of the early sons of Hambletonian. It is possible that his 2:30 list would not have been increased to a marked extent, but his 2:20 list would have been much larger than it is, and, more important than all, his sons and daughters would have produced speed with greater uniformity. That is where opportunity counts with a stallion of great merit—it gives or denies him the chance to make a name that will endure for more than one generation.

It has come to the knowledge of this office that certain men who are selling horses as standard bred refuse to give certificates of their pedigrees, and the question at once arises, If these men are afraid to give a certificate doesn't it look as if they knew the horses were not bred as represented?

There will not be any free-for-all races over the Grand Circuit this season.

Electioneer now has 102 in the 2:30 list.

Possibly the most notable performance of the present season was that on July 4th, of Mr. C. J. Hamlin's team—Belle Hamlin and Globe—when the pair trotted the kite track at Kirkwood, Delaware, in 2:12. This track is one of the down-hill variety, it being admitted by its owner that there is a fall of four feet in the mile. Consequently no record made at Kirkwood will be accepted by the American Trotting Register Association for purposes of registration and in the summaries of races trotted there it will be noted that the records were made on a track with the peculiarity above mentioned. This action will be taken in accordance with the rule of the American Register Association adopted April 15, it being proposed by Director Coleman and seconded by Director Ijams. The rule is as follows:

"*Resolved*, that the Registrar be instructed not to accept for purposes of registration the record of any animal not made on a track where the start and finish are not on the same level."

There will be a meeting of the executive committee and the Board of Censors of the American Trotting Register Association at the office, in this city, August 12, at 10 o'clock A. M. Among other business it is probable that the dispute as to the pedigree of Arion, the champion two-year-old trotter will be taken up.

People who believe in developed dams point to the fact that Mill Girl, 2:22¼, a daughter of Jay Gould 2:21½, now has two of her produce in the 2:30 list, and her owner thinks that two more will go in this season.

The Blue Bull mare, Rushville Maid, that is the dam of four standard performers, recently foaled a filly by Jay Bird.

The Ohio mare, Nightingale, that recently made a record of 2:21¾, is out of a daughter of Mambrino Howard, a son of Mambrino Chief.

Red Wilkes was bred to only four outside mares this season.

John Hughes, an old-time driver who figured years ago in connection with Annie Collins and Slow Go, died not long since at Allegheny City, Pa.

Digitized by Google

THE pacing stallion Shiloh, 2:21¼, has been sold to J. R. Mills, of Decatur, Ill.

A DRAFT from the Forbes stable, including Montrose, 2:18; Nellie McGregor, 2:25; Starlight, 2:26½; Bedouin, 2:28½, and a two-year-old by Stamboul, and out of a mare by Electioneer, is being handled at the Springfield, Mass., track by Scott McCoy.

THE American trotter Woodlark, a son of Hermes, won a dash race of two and one-half miles in Europe recently.

BEULAH, a daughter of Gooding's Champion, in foal to Direct, died in Kentucky last week.

THE dam of Bethlehem Star, 2:20¾, died recently in Kentucky.

BUSH, that recently took a record of 2:19¼ at Hartford, is only fourteen and three-quarters hands high.

THE Illinois pacer, Frank Oxman, who showed a great deal of speed last season, but was frequently distanced on account of breaking, has begun his song-and-dance performance again this year and got the flag at Danville, Ill., the other day.

THE Canadian stallion, Alvin, whose record is a fraction of a second better than 2:15, went a mile in 2:20¼, the last quarter in thirty-two seconds, at Detroit not long ago.

THE pacer Johnstone recently worked three miles in 2:15¼, 2:17, 2:15¼.

GLYCERA, 2:20¾, has been bred to Egthorne, 2:12¼.

IT is said in an Ohio paper that the price paid for Prince Warwick was $12,000, but the figures look a little swelled.

THE pacer Expert Prince, a son of Egbert, that recently made a pacing record of 2:19¾, is a sixteen hands horse, and looks a good deal like Temple Bar, who is also by Egbert.

VOL. XI, of the American Trotting Register will be issued about August 15, and those who desire copies should send in their orders as soon as possible. Price $5.00.

THE two-year-old filly Ferncliffe, by the pacing-bred stallion Elgin Boy, recently stepped an eighth in fifteen seconds over the Lexington track which is not only the fastest clip shown by a trotter of her age this season, but better than any of the matured trotters have gone the distance. Perhaps the timing was a little fast.

DIRECT 2:06, was bred to about sixty mares this year.

THE California pacer, Almont Patchen 2:15, is making a season on the Pacific coast, and will probably not be started this season.

THE latest addition to Nutwood's list of standard performers is that of the pacer, Sorrel Frank, 2:24½, made at Portland, Ore., not long ago.

DOBLE is training the pacer Birchwood that, as a two-year-old last season, made a record of 2:18.

Questions and Replies.

H. H. McM., MOORPARK, MICH.—1. Is Electro Palo standard bred and so registered, and what is his number? 2. Is his dam standard and so registered? 3. Give breeding in full of Electro Palo, and name of his owner.

ANSWER.—1. Yes; 18195; Vol. XI. 2. Yes. 3. Electro Palo, (6) br. h. foaled 1888; by Anteros, 6020; dam Governess (dam of Lasella, 2:28¼), by Governor Sprague, 444; g. d. Black Maria, 2:30½, by Alhambra, son of Mambrino Chief, 11; g. g. d. Enchantress (dam of Harold, 413), by Abdallah, 1. Bred by G. W. Morrison, Connersville, Ind.

E. W., FARMERS VALLEY, NEB.—1. Is there a standard and registered horse named Col. Simms? If so give number, breeding, owner, and under what rule registered. 2. Is Little Moak registered? If so give sire of his dam.

ANSWER.—1. Yes. Colonel Simms, 17016, Vol. XI, b. h. foaled 1888, by Charley Offut, 7753; dam Sadie, by Edgewater, 12730; 2d dam Cinda, by Jubilee Lambert, etc. Bred by A. C. Shropshire, Centerville, Ky. Last recorded owner, S. J. Wagner, Lushton, Neb. Standard under Rule 6. 2. Little Moak is registered as Mohawk Hambletonian, 13632; his dam is Eliza Jane, pedigree untraced.

J. M. B., EVANSVILLE, WIS.—Is any horse standard until he is duly registered?

ANSWER.—No. A horse may be standard bred or eligible to registration by breeding or performance, but is not standard until registered in the American Trotting Register.

SUBSCRIBER.—Can you give me the pedigree of a horse called Royal George, taken from Buffalo, N. Y., to Sacramento, Cal., in the seventies, by a man named Burton, where he made one season and returned east?

ANSWER.—We can not identify the horse. Perhaps some of our readers can, and will oblige the MONTHLY by giving the desired information.

Digitized by Google

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal*. The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

A. L. NEW 20377, (6) bl h foaled 1890; by Tom Sawyer 3974; dam Cuta Quinn, by Strathmore 408; g d Kate Patchen (dam of Bedford, 2:30), by Mambrino Patchen 58, etc. [See Cuta Quinn, Vol. VII.] Bred by A. V. Quinn (at Evanston, Wyo.), Phœnix, Ariz. T. [Vol. XII.]

ALNORA 20378, (6) b h foaled 1890; by Allandorf 7462; dam Nora Mapes, by Furor 3026; g d Hattie Mapes, 2:33½, by Abdallah Star, son of American Star Jr., etc. [See Nora Mapes, Vol. VI.] Bred by W. H. Richfield; passed to Richfield & Leathers, Lexington, Ky.; then to John Cudahy and Thomas Bennett, Chicago, Ill. [Vol. XII.]

ARABAS 20183, (6) b h foaled 1887; by Rooker 7415; dam Maud C., by Saint Nick 16339; g d Flora, by Caledonia Chief 392. [See Maud C.] Bred by Andrew N. Cline, Springfield, Ont., Can. [Vol. XII.]

BABY WILKESMONT, (6) ch m foaled 1892; by Wilkesmont 2332; dam Sunshine, by Merchant 599; g d Countess, by Clark Chief 89, etc. [See Sunshine, Vol. VIII.] Bred by Alph Aymond, St. Charles, Mo. [Vol. XII.]

BARONDALE 20184, (6) b h foaled 1890; by Baron Wilkes 4758; dam Nathalie, by Nutwood 600; g d Beatrice (dam of Patron, 2:14¼, and Prodigal, 2:17¼, etc.), by Cuyler 100, etc. [See Nathalie, Vol. VI.] Bred by R. G. Stoner, Paris, Ky.; passed to Tom James, Des Moines, Iowa. [Vol. XII.]

Entered according to Act of Congress, in the year 1891, by AMERICAN TROTTING REGISTER ASSOCIATION, at Washington, D. C.

TERMS: TWO DOLLARS PER ANNUM. SINGLE NUMBER, TWENTY CENTS.

THE METHODS OF PALO ALTO.

BY S. T. H.

IN presenting the statement that Palo Alto seems to be solving that exceedingly vexed question of crystallizing the form of the American trotting horse as he approaches perfection, the writer is well aware that he has ventured upon severely contested ground.

Aside from the legion of objectors who stand as a conservative bulwark in opposition to every advance of science, simply from the love of chronic antagonism to any change from established opinions, there are many able thinkers whose disinterested conclusions, and others whose horse interests oppose this proposition. The former are entitled to more respect than the latter. Thoughtful students of physiology have maintained that the carcass should be balanced, equal in height at the withers and over the coupling, which measurement should correspond with the length of the carcass from the point of the shoulder to the posterior extension of the hip. Then it is claimed the body is balanced, and in the best possible position for the greatest speed. They furthermore assert that undue height at the withers, which is the defect of the thoroughbred formation, and a greater height at the coupling, which disfigures so many great trotters, and the drooping of the hind quarters, that mars the symmetry of the old-time pacers, are all physiological imperfections. The perfect trotter, they conclude, will never materialize till these unequal sections are reduced to the balanced mechanicism. Others assert with equal confidence that, physiologically considered, the swift trotting horse is peculiarly *sui generis*, so far as relates to his exceptional structure, that bids defiance to the laws of physiology. He assumes all shapes, sometimes higher behind, sometimes higher in front, and sometimes equal in height at both ends. They admit that the pointer, and the setter, and the collie, and all the varieties of lower animals bred for a specific purpose have a distinctive conformation, but the law ceases to have any influence when the trotting horse is under consideration. They deny that these variations in the trotting form result from the crudities of breeding, or the absence of the evolution of a distinctive type; but that the trotting horse is the one single exception, in animated nature, to the otherwise inexorable laws of physical construction. He always has, and always will, come and trot fast in all shapes, and there can never be evolved a distinct physical type. At times he will assume the formation of the greyhound, like Rarus. At other times he will approximate to the coupe horse in size and power, like the late gigantic Gloster, and at other times to the lady's palfrey, like the diminutive Molly Morris. But which end shall prove to be the higher is merely an accident of formation, not a governing feature of the locomotion. When confronted with the numerical argument, which casts aside all physiological deductions, and informed that the four fastest trotting performers—Sunol, Palo Alto, Maud S. and Nancy Hanks—are all higher over the coupling without a single exception, and that the eight trotters that have beaten 2:12, including, in addition to the

Digitized by Google

above, Allerton, Nelson, Arion and Delmarch, are also all higher over the coupling, with the single exception of Allerton, thus making seven out of the eight greatest performers thus endowed with the distinctive trotting pitch, the objectors, one and all, beg the question by assuming the doubting Thomas character, and stoutly asserting that they will not believe these measurements till taken by their own hands. When the public disputant is, in extremis, thus driven to the infinitessimal wisdom of his own experience, to the exclusion of the experience and conclusions of the *wide, wide* world, with its untold millions of superior opportunities for knowledge and correct determinations, he has more completely acknowledged his discomfiture than if it had been done by a candid confession of defeat. Personal property interests have no weight in the determination of a comprehensive question in science. When, therefore, a breeder opposes this trotting pitch simply because his premier sire does not conform to its requirements, his opposition would be transferred to the other side, very eagerly, if his representative horse was formed like the greatest recorded trotters. From a distinguished breeder and thinker, often quoted in these papers, comes this protest: "There is no trotting form, *only trotting instinct.*" "I know a thoroughbred and a trotter that look very much alike, *yet one trots and the other gallops.*" They may look alike to the eye, yet measure differently over the coupling and at the withers. Such vague statements are the arguments of even sincere opponents to the trotting pitch. The conclusion above expressed argues that the trotting-pitch conformation can not be correct, because it has not yet assumed an universally distinct type that admits of no exceptions. Such an adverse conclusion, in the face of the manifold, incongruous elements that have entered into the formation of the American trotting horse, and the rapidity with which he is evolving, in both lineage, conformation and performance, is palpably unscientific. From careful horsemen, like Budd Doble, comes somewhat unfavorable answers, at first blush, like the following: "I took the measurement of Axtell myself to-day, with his head on a line with his spinal column, and he measured fifteen three and a quarter hands in front, and a trifle less than fifteen three and a quarter hands over the coupling."

The slight variation of both Allerton and Axtell from the "trotting pitch" is susceptible of a satisfactory explanation based upon physiological laws. The dams of both were daughters of Mambrino Boy. Like all the sons of Mambrino Patchen, indeed, like the vast majority of the descendants of Mambrino Chief, immediate and remote, in the male line, Mambrino Boy was high and sharp over the withers. This peculiarity of form was intensified from the formation, forehanded, of his dam, Roving Nellie, who was by Cassius M. Clay out of a daughter of Berthune. Among thoroughbreds Bedford was noted for his high coupling, while Berthune was equally distinguished for his altitude over the withers. The trotting pitch was, therefore, powerfully influenced in Axtell, while his frame is about balanced. That of Allerton is pitched like that of Berthune, reinforced by the sharp withers inherited from Mambrino Patchen, who not only received it from his sire, Mambrino Chief, but from his dam by Gano, and his grandam The Pacer. It has been stated with apparent triumph that the three greatest trotting stallions of the past season, Allerton, Temple Bar and Dr. Sparks, are higher in front than over the coupling. These statements are made without reference to the physiological influence of the maternal line upon conformation. Allerton, it has been shown, received his high withers from the dam and grandam. Dr. Sparks and Temple Bar both having the same record of 2:17¾ are in the same line of explanation. Temple Bar was sired by Egbert, whose trotting pitch, as has been noted, like that of all the Hambletonians, was very pronounced. But his dam, Nettie Time, was by Mambrino Time, who received the high withers from both sire and dam.

Now take the instance of Dr. Sparks. He measures sixteen hands one inch behind and an inch higher in front. He was sired by Cyclone, dam Lily by Munroe Chief, grandam Jenny, by Leo, son

of Texas. His sire Cyclone was by Caliban, he by Mambrino Pilot, son of Mambrino Chief, while the sire of his dam Monroe Chief was by Jim Monroe out of a daughter of Bay Chief, son of Mambrino Chief. Thus Dr. Sparks is a strong combination of inbred Mambrino blood, being a lineal descendant, a grandson of Mambrino Chief, while the sire of his dam was out of a granddaughter of Mambrino Chief.

The query then arises if the Mambrino Chief maternal cross thus modifies and, in some instances, reverses the trotting pitch, what is the ultimate result? Very frequently the Hambletonian trotting pitch controls the offspring, if not in the very first, most certainly in subsequent generations, even when it is absent in the sire. Thus Axtell is nearly the same height at the withers and coupling, but his best son, Axle, measures fully an inch higher over the coupling. The strong probabilities are that Allerton will follow the same law in his produce; for eventually the Hambletonian peculiarities predominate as the stronger inheritance. In these sires the Mambrino high, sharp withers have already been considerably modified, for Jay Bird, in the instance of Allerton, and William L. still more in the case of Axtel, have materially reduced this variation from the trotting pitch, which makes them slight exceptions to the great trotting performers of the first class. But the absence of the trotting pitch may have a deeper significance than has yet been suggested. Many reasons have been offered by writers why the Mambrino Chiefs as sires in Kentucky have not equaled the record of the Hambletonians, in precisely the same fields of broodmares. Mambrino Chief occupied that harem of inestimable value first. He was taken to Kentucky five years before Alexander's Abdallah, the pioneer of the Hambletonians, was transported to that land of highly-bred broodmares. The late Mr. Edwin Thorne informs us that Mambrino Chief trotted a trial mile, over the Washington Hollow track, in 2:32, before he was purchased by Mr. James B. Clay, in 1854. Alexander's Abdallah's best record is only 2:42! The former made eight seasons in Kentucky, while the latter made only six; and yet, the Hambletonians in the male line not only largely outrank the Mambrinos as trotting sires in Kentucky, but in every other state in the Union where the trotting horse is the subject of scientific breeding.

The statistics of their respective potency, as trotting sires, have been the mystery of mysteries to the student of the breeding problem. The Year Book for 1891 thus gives the resume for comparison: Hambletonian (10) sired 40 standard performers, and 59 daughters the dams of 73 trotters and 1 pacer; and 129 sons the sires of 955 trotters and 48 pacers! Mambrino Chief (11) sired 6 standard performers, and 17 daughters the dams of 23 trotters, and 23 sons the sires of 87 trotters! What is the biological explanation of this enormous discrepancy? The Mambrino family has become famous for great speed and courage. Guy, 2:10¾, and Prince Regent, 2:16½, and Mocking Bird, 2:16¾, and Black Cloud, 2:17¼, and Trinket, 2:14, and Patron, 2:14¼, and Jerome Turner, 2:15½, leaving out the mighty mare, Lady Thorne, 2:18¼, have demonstrated its capacity for great speed and indomitable game! These seven best had the Mambrino Chief conformation. They were higher in front than over the coupling. Compare them with Sunol and Palo Alto and Maud S. and Nancy Hanks and Arion and Delmarch and McKinney. These are the seven best of the Hambletonians that have the Hambletonian trotting pitch. The test of gameness is in direct ratio to the rate of speed maintained. Granting that the courage was equal in both families, the vastly superior speed in quality, as has also been shown in quantity, so largely predominates in favor of the Hambletonians that it is an unfounded assumption to claim that conformation is not an influential factor in this startling comparison.

Hambletonian stood an inch higher behind than in front; Mambrino Chief was exactly the reverse in conformation. This was not accidental, but in each instance an inheritance. It is the testimony of expert horsemen that Hambletonian not only thus stood an inch higher over the coupling, but that the same trotting pitch marked the structural

Digitized by Google

formation of his dam. Their descendants have preserved, in the main, these structural differences in conformation. The Hambletonians are broad and low over the withers, which was long considered to be a defect in structure before the trotting shape began to assume a distinct type with a strong illustration of the "trotting pitch" by rising from the saddle place to a higher elevation over the coupling, accompanied by a muscular wealth, on the inside as well as the outside sections of the hams of the hind quarters that gives them an appearance of overburdened surplusage of power behind. The Mambrinos as a family, on the contrary, are not only higher and sharper at the withers, resembling in that particular, though decidedly not in their heavier heads and ears and coarser throat latches, the finished thoroughbreds, but their hind quarters, though not drooping, are on a lower elevation than the peak of the withers, with a less display of muscles on the inside of the thigh, as evidenced by the height to which they are "split up," between the hind limbs. To this marked absence of the "trotting pitch" may not probably the inferior success of the Mambrinos, in both the number and quality of their trotting performers in the male line be fairly attributed? The writer is not insensible to the far-reaching potency of the Mambrino family in furnishing incalculable assistance to the broodmare lists of trotting pedigrees. It is only the deficiency in the male line that is rendered by the comparison all the more striking. One thing is certain that Gov. Stanford has never selected a Mambrino for a trotting sire, at Palo Alto! . This is the more remarkable when the sensational performances of Lady Thorne and of Guy, and the popularity of Kentucky Prince and of Mambrino King are remembered. He has steadily adhered to the Hambletonians, his premier, Electioneer, having the "trotting pitch" and his greatest performers, Sunol and Palo Alto, being thus strikingly formed. The physiological objection to this structural formation is apparently more serious to the theoretical naturalist than the actual weakness in the carrying capacity, among great trotting performers, thus constructed will warrant. Naturalists, in all countries, insist upon a balanced structure for the greatest physical capacity. Moreover they contend that the undue development of one portion of the organism is plainly at the expense of its co-ordinate part. Applying these conclusions to the horse, they contend that when the horse is balanced, that is, when he measures as high at the coupling as he does at the withers, and as long from the shoulder points to the posterior projections of the hips as he is high from the ground to the withers and the coupling, then the carcass is exactly balanced, upon perfectly proportioned limbs, and other essentials being present, such as blood elements and development, he can perform his duties, be they that of the draft or the race horse, with greater effect than if the mechanism was out of balance.

Applying these conclusions to the trotting horse, they would contend that he should not be higher behind than he is in front, but that undue elevation and consequent excess of development at either end is necessarily at the expense of the other. If he is higher and more powerful in the posterior structure, then he will have a surplusage of propelling power behind, and a deficiency of carrying power in front. If the stifles and hips are unusually high, and long, and broad, the forearm will be correspondingly deficient in length and general measurement. Following in the trend of these scientific deductions, the opponents of the "trotting pitch" may refer to the rabbit, and the kangaroo, both of which are enormously developed behind, at the expense of the forehand structure; so much so as to make them deformed, from the exaggerated results of the evils of excessive posterior development. Yet these plausible illustrations are strikingly inapposite. Neither the rabbit nor the kangaroo trots, but progress only by a series of leaps. However plausible therefore these illustrations may seem there is no analogy in fact. Neither the hare nor the kangaroo are adapted for progression on macadamized roads—having footpads instead of hoofs—nor are they designed to overcome draft burdens; nor have they been bred or developed to subserve any definite domesticated use.

Digitized by Google

nifestly the weak, shrunken, diminished forelimbs and the long, powerful hind quarters and limbs of their structural peculiarities were designed to prevent trotting or pacing locomotion, or any other movement except that of hopping. Both can sit upright, with ease, by reason of this confirmation. Indeed this is one of their favorite positions at rest. Moreover their method of locomotion is contrary to that of the trotting horse. They move the hind pair of limbs together, and land upon the front pair of limbs simultaneously, while the trotting horse works only one hind quarter in propulsion at a time. This diversity of action would alone forever prevent the massive development of the hind quarters of the trotting horse to the enfeeblement of the front limbs. As a physiological fact, the increase of propelling power of the hind lever stimulates a corresponding increase of sustaining capacity in the fore limbs. The mere altitude behind does not and can not preclude this corresponding development, well placed, in the forehand structure. As a matter of fact, neither Sunol, nor Maud S., nor Palo Alto, nor Nancy Hanks, that have this pronounced trotting pitch formation have any perceptible or actual weakness of the fore limbs, either of the bone structure or the muscular development. The enormous development of Hambletonian over the coupling and hips, coupled with his elevation behind, an inch higher than at the withers, made him appear, at first, too massive for action. But when he moved this formation proved its superiority, for he was "all action." In this structural peculiarity, Electioneer, the late premier stallion, at Palo Alto, very closely resembled his sire; so much so that the very thoughtful writer Aurelius, contended that he "lacked carrying capacity forward, or in other words, that his carrying capacity was not equal to his propulsive capacity." "When the carrying power of the Electioneers is exhausted he assumed the machinery stops." This is the most serious objection to the "trotting pitch," if it is tenable, because it relates to the capacity to carry forward the speed generated by the propelling muscles of the hind quarters. Undoubtedly the propelling power is largely located there, and the main office of the fore limbs and feet is to prevent the carcass from being forced, headlong, upon its face, when the momentum becomes extreme. There are two methods of arriving at the exact truth as to the comparative strength of Electioneer and his get, forehanded, and and in the hind quarters; the one relates to the measurements and observations of competent horsemen who have made a thorough study of his anatomy, and the other refers to the test of actual turf trials. If their natural and acquired capacities were equal, it will be universally conceded that the opportunities of Charles Marvin, one of the greatest of practical trotting horsemen, for knowing all about the mechanism of Electioneer, and of his produce, were incomparably greater than those of Aurelius, one of the foremost of modern writers on the trotting horse. The former came into daily association with them for many years; the latter derived his knowledge from what he "was able to gather from personal enquiry." Aurelius says Electioneer was thus forehanded, "structurally imperfect."

Mr. Marvin, in answer to recent enquiries on this subject from the writer says: "Few families are better muscled "in the forearms than the Electioneers. "Electioneer, himself, never had any de-"ficiency of the forearm. Joseph Cairn "Simpson and myself frequently meas-"ured him, and he measured twenty-one "inches around the forearm, and was "very stout over and through the shoul-"ders. There was no 'tie in,' at the "elbows. The fore legs of the Elec-"tioneers, as a family, were close to-"gether. Their gait is close, not wide, "and as a rule they are line trotters. "Neither did Electioneer nor does his "get lack carrying capacity forehanded. "Being so heavily and powerfully made "behind, a superficial judgment would "be that they might be deficient forward. "I have frequently speeded Electioneer. "He could almost any time trot a "quarter in thirty-five seconds. *I timed* "*him a quarter in thirty-four seconds,* "*drawing a spring sulky weighing one* "*hundred and twenty-five pounds and a*

Digitized by Google

"*driver weighing one hundred and twenty*
"*pounds!*"

These facts are of the weightiest import in determining this important matter. The carrying capacity of Electioneer must have been absolutely perfect for him to attain that high rate of speed barefooted. Very rarely is a trotting horse balanced without the aid of shoes. The front shoes are always heavier than the hind ones, for the purpose of extending the front feet and of keeping them out of the way of the hind action. If this method was reversed and the front shoes were made lighter than the hind ones, the vast majority of trotting horses would forge and interfere and speedy cut so frequently as to lose all confidence, and absolutely refuse to show great speed on the trot. The fact that Electioneer's gait was thus so perfectly balanced, barefooted, proves, as Mr. Marvin asserts, that there was no deficiency of the forearm, and that he was very stout over and through the shoulders. Moreover, all of his get trot in slippers. Their feet are never heavily armed. The front shoes weigh from four to eight ounces, and toe weights have no existence at Palo Alto. But, independently of the proof of the Electioneers' perfection of structure, drawn from their balanced action, is the fact that this balance is preserved notwithstanding the fact that all of them, "as a rule, are line trotters." The carrying capacity, forward, must be much more powerful and effective in line trotting than in wide action, for the manifest reason that there is no lost motion behind, and, therefore, no extra time given to the front feet to revolve out of the way of the hind stroke. In line trotting the hind levers work forward without any perceptible outward swing, directly up under the body, and if there is any lack of action of the front limbs and feet arising from muscular deficiency forehanded from the withers to the knees, or any imperfect structure, such as the feeble development of the muscles which separate the anterior limb from the ribs, which brings this region, in the words of Gobaux, too close to the thoracic walls and places the elbows on the body. The front feet and limbs could not possibly escape the hind stroke, but constant and destructive interference would result.

But it may be claimed this interference would only obtain when the feeble carrying power, forehanded, is exhausted. While this is not true, for the excessive action behind would make its force felt at every rapid revolution, yet it would possibly be more apparent when the less powerful fore limbs had become wearied by the tremendous action of the stronger hind movement. The best possible test of this condition would be the rating of the Electioneers at their highest efforts of speed. The finishing quarters of Sunol and Palo Alto and Arion, and even of Bell Bird, from aged to yearling trotters, indicate no lack of carrying capacity forehanded. Indeed their speed is so remarkably well sustained that the blood of the dam, whether thoroughbred or trotting bred, does not seem to have been a potential factor in the forward carrying capacity. The peculiar diagonal movement of the trot which causes one hind limb to propel the mechanism at a time, and the opposite fore limb to separately hold up the carcass, and retain its center of gravity, in the next instant, will necessarily promote a development, forehanded, in harmony with the enormous muscular power behind. Instead of enfeebling the forearm the very practice of more rapid trotting must necessarily strengthen and develop its carrying capacity. The altitude and visible power behind, to the most casual observer, may make the horse forehanded, seem to be deficient, by contrast, but, as Mr. Marvin correctly observes, "this is a superficial judgment." If Electioneer and his get were thus structurally imperfect, forehanded, he never could have established a trotting family pre-eminent in speed as race horses from all classes of mares. It has been intimated that the dams in his California harem have assisted in overcoming his alleged forehanded structural weakness. The broodmares at Palo Alto are not superior in quality to those at Stony Ford. At the latter farm he never had access to them, and that is the only reason why he did not beget phenomenal trotters in the East.

Referring to this fact, Mr. Charles Backman thus writes to the author:

Digitized by Google

"There is no mystery in the career of "Electioneer, when the facts are known. "I had, at the time I owned Electioneer, "at least twenty sons of Rysdyks Hamble-"tonian. Some of them never served a "mare till after they were nine years old. "I do not remember of any one of the get "of Electioneer being trained. I am quite "sure that I never broke one to harness. "At the time I owned Electioneer both "Messenger Duroc and Idol were in great "demand with my patrons, consequently "Electioneer had to serve inferior mares. "But his disposition and physical nature "were perfect."

Here is plainly and truthfully revealed the secret of Electioneer's success. From both sire and dam he inherited the altitude and enormous development of the hind quarters, which gave him the pronounced trotting pitch. He was permitted to grow naturally, without premature forcing, into a full, rounded maturity, without exhaustive development on the race course, or excessive drainage, during his growing years, upon his vitality, during his colthood, either upon the track or in the harem, that would certainly have mortgaged his constitution in after life.

His breeder says "he was never driven "a half mile at speed while I owned "him. His colts were so few that "none of them were ever broken to "harness by their owner." Thus, in the full maturity of his capacities, at nine years of age, Senator Stanford secured Electioneer as the premier stock horse of Palo Alto, after his bone structure had become perfected, and his muscular system sufficiently developed to show his purity of action, his capacity for great speed and his ability to trot fast, with perfectly balanced action in his bare feet. To these conditions of a perfect maturity, without the detraction of exhaustion from any source, superadded to his superb breeding, may be attributed in a large measure his marvelous success in the harem.

The skeptical reader may exclaim, "His success is due more to his blood lines, and his complete maturity than to his 'trotting pitch.'" If Electioneer alone, among the great trotting sires, had this structural formation, the adverse conclusion would be tenable. But when to Electioneer's conformation is added the similer altitude of George Wilkes over the coupling and of his best son Red Wilkes, and of the greatest living sire of standard trotters, the great Nutwood, the coincidence is certainly more than accidental.

In response to a recent inquiry from the writer, the Messrs. Stout thus reply: "This morning we had Nutwood accu-"rately measured, with the following "results: *Nutwood* 15 1½ *over the withers* "*and* 15 3½ *over the coupling.*" Nutwood is twenty-two years old. Age palpably lessens the rear elevation of the horse. This fact makes the pronounced height of Nutwood over the coupling all the more remarkable. Now to this enumeration of excess of height over the coupling of the great trotting sires add the similar conformation of the great trotting performers that have made records of 2:12 or better, and we have Sunol, Palo Alto, Maud S., Nancy Hanks, Arion, Jay Eye See, Nelson and Delmarch. Axtell is about the same height at the withers and over the coupling, while Allerton is one-quarter of an inch higher in front. When it is remembered that there has been no crossing or breeding with reference to the trotting pitch, and that nature unaided has thus plainly indicated that formation as the best possible structural adaptation to extreme trotting speed and the attainment of a higher average of trotting speed, it is the more remarkable that the proper form should be thus strongly and generally indicated. Instead of two out of eight of the greatest trotting performers being the exceptions, the wonder is, taking into consideration the positive disbelief in the trotting pitch, as well as the absolute indifference to the same, that the exceptions are not numerically greater. Indeed from the answers already received on this subject from horse owners, the writer is convinced that if a tabulated list of all the great trotting sires and of the most distinguished trotting performers had been preserved of the relative heights over the coupling and at the withers, it would be found that the trotting pitch is the almost universal rule with the best trotting strains,

Google

excepting the Mambrino family, and that the reverse is the rare exception.

These controlling instances eliminate the possibility of the trotting pitch being accidental, much less a freak of nature. Certain it is that the great sires, and the great performers bred at Palo Alto are all, without a single exception, stamped with this formation. It makes very little difference whether the withers are sharp or round, they are lower at this great establishment than the coupling.

In a recent communication on this subject the superintendent says: "Electioneer had round withers, almost the "width of your hand. He was fifteen "hands, two and a half inches high at the "withers. He was higher over the coup-"ling."

Then follows the measurements of his most distinguished sons:

Name.	*Height at Withers, Hands.*	*Height at Coupling, Hands.*	*Shape of Withers.*
Electricity	16.2	16.2½	sharp.
Advertiser	15.1¼	15.1½	round.
Palo Alto	16	16¼	sharp.
Bernal	16¼	16¾	round.
Alfred	16.2	16.2½	sharp.

The "trotting pitch" becomes more confirmed in each succeeding generation. "'The yearlings,' adds Mr. Covey, by "Electricity, are so much higher at the "coupling than at the withers that it is "the cause of much comment even by the "ordinary visitor. *They are a remark-"able lot of colts.* Advertiser's sucklings "have much the same formation. About "thirty per cent. of Palo Alto's get have "the rounded withers and are higher at "the coupling. I notice now, specially, "that all of the get of Norval we have "are higher at the coupling. This is "quite remarkable, as we have but few "of these, and those that have been "handled have all beaten two minutes "and thirty seconds!"

How beautifully less grows the rationale of the time-honored platitude that the trotting horse has no form, only trotting instinct.

But the investigation of this secret of Palo Alto's marvelous success is not limited to the sires.

The two broodmares that have produced extreme speed are Waxana and Dame Winnie. Both are in the great broodmare list, and both are higher over the coupling than at the withers. Both are long, low, powerful mares, with the sharp withers of the thoroughbred formation. Waxana is fifteen hands an inch and three-quarters at the withers, and one-quarter of an inch higher over the coupling. The royal broodmare among thoroughbreds in the production of standard trotters is the famous Dame Winnie She stands higher behind than any thoroughbred mare in this vast collection, being fourteen hands two and three-quarters inches in front, and an inch and three-eighths higher over the coupling. This is an exceptional formation for a thoroughbred. Governor Stanford affirms that she was selected as a trotting broodmare because she showed remarkable trotting action over the streets of Lexington, Ky., on the day she was purchased for the Palo Alto ranch. From her pronounced "trotting pitch" such action was the natural result of her structural formation. She has produced four standard performers whose records range from 2:08¾ to 2:30, and they all have the same distinctive trotting pitch. The physiological demonstration could not possibly have a more powerful illustration than the brood history of Dame Winnie affords.

Most of the thoroughbred broodmares that have begotten a single standard trotter at Palo Alto are formed like Esther (the dam of Express, 2:21), the daughter of Express out of Colisseum by Colossus, son of Imp. Sovereign. She stands exactly fifteen and three-quarters hands high at the withers and over the croup, but when a greater broodmare, like Emma Robson, the dam of Emaline, 2:27½, and of the wonderful three-quarter-bred yearling Rowena, is measured, she is found to be, like Dame Winnie, higher over the coupling than at the withers. When the biological student compiles a mass of facts all tending to one incontrovertible conclusion, the establishment of the "trotting pitch" seems to be on the border of general recognition.

Whether this result was among the original designs of the founder of Palo Alto, his selections and breeding methods have tended very rapidly to demonstrate the highest trotting formation as well as the combination of richer blood

Digitized by Google

elements, by means of a larger infusion of thoroughbred blood. The trotting pitch commends itself to the student of mechanical forces with reference to their most advantageous placement. Because the trotting action is diagonal, one hind quarter mainly propels the entire organism at a time. The hind quarters should, therefore, be enabled to work to the greatest advantage. Plainly, if they are elevated, the exalted position gives them a vantage ground for action as well as a longer leverage capacity. Especially the hocks are let down low, and the cannon bones are short, which combination is a necessary condition for great trotting speed. The horse thus constructed moves with lighter shoes, for he is balanced for trotting action while at rest as well as in motion. Mr. Bair wore four-ounce toe weights on the front feet of Maud S., but Mr. Bonner found she had all of her speed without these appliances.

The pacer is generally higher in front, and, proverbially, when converted to trotting, the change can only be accomplished by the use of toe weights. This clearly indicates that excess of height at the withers means additional weight on the front feet to balance the action. No more striking proof can be cited than that of the great Allerton. The attempt was made to reduce his front shoes from nine to six ounces in front, and, after repeated experiments the old shoes, weighing nine ounces each, were restored, to perfect the equilibrium of his action. To this enrichment of blood and perfection of form, Palo Alto has more sharply defined line trotting than any other stock-farm, as the perfection of swift trotting movement. All the Electioneers, Mr. Marvin says, are line trotters, and the present glory as well as the perpetuity of the fame of Palo Alto largely rests upon Electioneer and his sons. There can be no other essential structural qualities for great trotting speed. Neither height nor color can be made arbitrary; nor are they necessary, for not only have some of the greatest performers been undersized, but though they may have been small, yet they were perfect in proportion, while color is simply a matter of taste, having reference to neither form, speed nor endurance. If Palo Alto is successful in thus permanently establishing the highest form, the richest pedigree, and the extremist speed, it has advanced very far toward the perfection of the American trotting horse. The succeeding paper will treat of the routine practical methods of Palo Alto.

HORSE SENSE.—Continued.

BY A.

II.

Does the Horse Know the "Airts?"—The English language seems deficient in possessing one word to define the different points of the compass. What word can be matched with the one in the tongue of Robert Burns italicized in the phrase: "A' th' *airts* th' win' can bla'?" An *airt* means one of the four "points;" *airts* include them all. There are indications that the horse may develop powers of distinguishing the *airts*. J. K. Lord, F. Z. S., tells the following: "I once, while living in the far west, rode a horse from my camp across a prairie to an encampment of squatters, a distance of more than twenty miles. A river of some width was crossed on the route, the horse being ferried over in a large boat. The animal had never traveled the road previously, nor had it ever run upon the prairie, and yet, during the night it contrived to break its tether line and in the dark to find its way back to our camp. But, what is more strange, the horse actually swam the stream it had during the day been ferried over in a boat. By what means, it may be asked, did the horse contrive to find its way over a grassy waste never trodden by it previously to a given point so far distant? There was no path or trail, and in the dark the horse could not, except by

Digitized by Google

smelling, have retraced its own footprints." Charles Darwin relates this: "I sent a riding horse by railway from Kent via Yarmouth to Freshwater Bay, in the Isle of Wight. On the first day that I rode eastward my horse, when I turned to go home, was very unwilling to return toward his stable, and he several times turned round. This led me to make repeated trials, and every time I slackened the reins he turned sharply round and began to trot to the eastward by a little north, which was nearly in the same direction of his home in Kent. I had ridden this horse daily for several years, and he had never before behaved in this way. My impression was that he somehow knew the direction whence he had been brought. I should state that the last stage from Yarmouth to Freshwater is almost due south, and along this road he had been ridden by my groom, but he never showed any wish to return in this direction. I had purchased the horse several years before from a gentleman in my own neighborhood who had possessed him for a considerable time. Nevertheless, it is possible, though far from probable, that the horse may have been born in the Isle of Wight."

Steps Toward the Use of Tools.—It is common to read such sentences as this: "I have seen a mare that whenever she could get her halter slipped off would open the door out of the stable and that into the feed room, raise the lid of the feed chest and help herself to what she wanted, but never took too much, no odds how much was there." The teeth and lips are "the hands" of the horse, to help the animal in its prehensile efforts. The writer has known a horse that could thus undo the knot of a hitching chain, simply, or at first for amusement.

Lord Brougham, in his "Dialogues of Instinct," instances a horse that secured admittance to a pasture field by pressing down the upright bar of the latch, just as a man would do. There is another instance where a horse, to accomplish this, had to obtain the connivance of a donkey in the coveted field. While he lifted the latch the latter pushed the gate open, as it leaned heavily on its hinges toward the fastening. On accomplishing such "tricks" the adepts would dash around the forbidden pastures as recklessly as schoolboys might celebrate the advent of the holidays.

Bayard Taylor published an interesting article in which he said: "I have a horse who is now not less than forty-one years old. He is at present on the retired list. I have seen him through a crack in a board shanty, used while the stable was building, lift and lay aside with his teeth six boxes which were piled atop of one another, until he found the oats at the bottom. Then, when my head appeared at the window, he instantly gave up his leisurely, luxurious munching of the grain, opened his jaws to their fullest capacity, thrust his muzzle deep into the box, and gravely walked back to his stall with at least a quart of oats in his mouth.

Romanes tells us of a horse he owned which was very clever at slipping his halter after he knew that the coachman was in bed. He would then draw out the two sticks in the pipe of the oat-bin, so as to let all the oats run down from the bin above upon the stable floor. Of course, he must have observed that this was the manner in which the coachman obtained the oats, and desiring to obtain them, did what he had observed was required for such purpose. Similarly on other occasions he used to turn the water-tap to obtain a drink, and pull the window cord to open the window on hot nights.

The following shows the intelligence of a Kentucky roan who was left in an open paddock fastened by means of a wooden hasp: This he learned in a few days to take out with his teeth and drop on the ground, only to have it carefully replaced by the stable boy, who displayed a wonderful intuition about discovering it. Finally, when it became plain to the equine understanding that there was nothing to be gained by such performance, he tried the experiment of carrying it over to the farther side of the fence and letting it fall into a neighboring yard. Now it so happened that his owner caught him in the act and relentlessly fastened him in again; then from a distance he watched to see what he would do next. As he had expected, the horse diligently loosened the stick again,

Digitized by Google

ut—now comes the queer part of it—nstead of putting it in any of the old laces, he gave one defiant snort and laoriously set to work to eat it up. If is object was the total annihilation of he hasp, there is no doubt that he acomplished it fully.

So common has the power of unlatchng become among horses that live stock apers give directions for its prevention, hus: "Put on two latches. A man with wo hands can manage them; a horse with ne nose can't. That's where the man as the advantage of the horse."

Mrs. R. Lee tells a characteristic story f Nannie, a mare belonging to her father, who was one who "jumped over the dining table," covered with crystal galore, as a result of the usual wager over such a feat. This clever mare constantly opened the door of her stable, *and went to warm herself at the fire* at the harness room. The discovery of the fact of heat proceeding from the stove must have been a wonderful experience in the life of Nannie.

Mr. W. J. Fleming mentions a vicious horse he had which, while being groomed, frequently used to throw a ball of wood attached to his halter at the groom. He did so by flexing his fetlock and jamming the ball between the pastern and the leg, then throwing the ball backward with great force.

A lady of Cusetta, Ga., reports that one of her horses was seen to pick up a good-sized plank in his mouth and hurl it at a negro with terrific force. We recollect reading of a horse who, to more materially effect his desire of pleasing his companion in the pasture, picked up a suitable stick and used it to scratch the back of the other. It is a common habit, as everyone knows, for horses in the field to scratch, apparently viciously biting with their teeth each others' necks, shoulders and withers.

Lord Brougham mentions a horse which, having watched the men pumping water into his trough, raised the water himself by working the handle up and down with his teeth. He took the handle in his mouth and worked it with his head till the trough had received a sufficient quantity of water to satisfy his thirst

On one occasion, a horse having consumed his allotment of hay, ascended by the stairs to the hay loft, the floor of which being frail, was penetrated by his legs, so that he was found in a very helpless condition, but in such a position as led those who saw him in it to suppose that he had been attempting to push a new supply of hay into the rack.

The War Horse.—The horse seems to possess the pride of the eye, and to realize the pride of life. That legendary horse, Bucephalus, who had the figure of a bull on his forehead, horns like a bull on his head, and divided hoofs, would allow no one but Alexander, his master, to mount him. In the last battle of the campaign in India this nobly minded horse was mortally wounded. For the first time in his existence he disobeyed his master's commands. Summoning up all his strength for one supreme effort he fled with Alexander from the thick and heat of the fight, with extraordinary swiftnesss, to a place of safety. Then he knelt for his worshiped master to dismount, and immediately yielded up his spirit.

Julius Cæsar's horse had a similar discrimination as to whom he allowed to mount him. Napoleon's famous charger, when in his trappings, would not allow any one to ride him but the emperor. Napoleon himself described this trait of his favorite horse: "He realized," he said, "that he had a superior being on his back." He recognized the little corporal on every occasion, and received and recovered from many a wound obtained in battle. These "stories" illustrate traits that had certainly been observed to exist in the horses of early and late times.

After General Sir R. Gillespie fell at the storming of Kalunga, his favorite black charger was purchased by the privates of the Eighth Dragoons who contributed their prize money, to the amount of £500, to retain this commemoration of their late commander. Thus the charger was always led at the head of the regiment when on a march, and at the station of Cawnpore was usually indulged with taking his ancient post at the color stand, where the salute of passing squadrons was given at drill and on review.

Digitized by Google

When the regiment was ordered home, the funds of the privates running low, he was bought for the same sum by a relation of Col. Hamilton Smith (the narrator), who provided funds and a paddock for him, where he might end his days in comfort. But when the corps had marched, and the sound of the trumpet had died away in the distance, he refused to eat, and on the first opportunity, being led out to exercise, he broke from his groom, and, galloping to his ancient station of the parade, after neighing aloud, dropped down dead.

Mr. T. L. Oswald mentions in his "Zoölogical Sketches" that Major Keogh's old roan, the only survivor of the Big Horn massacre, was found limping about the battlefield with eleven bullets in his body, but always coming back at short intervals to the spot where his master's body lay. M. de Boussanelle, captain of cavalry in the regiment of Beauvilliers, mentions a horse belonging to his company that was disabled by age for eating his hay or grinding his oats, which was fed for two months by two horses on his right and left, who ate with him. They drew the hay out of the rack, chewed it and put it before their aged comrade, and, in the same way, prepared for him his portion of oats.

The Tyrolese, in one of their insurrections in 1809, took fifteen Bavarian horses, on which they mounted as many of their own soldiers. A reconnoiter occurring with a squadron of the regiment of Bubenhoven, these horses, on hearing the trumpet and recognizing the uniform of their corps, set off at full gallop and carried their riders in spite of all their resistance into the midst of the Bavarian ranks, where they were made prisoners.

A detachment of cavalry horses had been temporarily placed in some grass fields in the vicinity of Loudon castle, in the west of Scotland. The day was heavy and sultry. The thunder, which had been first heard only at a distance, began to increase in loudness and frequency, and drew the marked attention of the horses. As it still became louder and the numerous peals echoed along the extensive slopes of the moor, crept along the water of Irvine, or were reverberated through the woods, the horses became animated with the same enthusiasm which seizes them on hearing the rolling sounds emitted from many cannon. They rushed together, and, rapidly arranging themselves in their accustomed ranks, presented the front of a field of battle.

Two Hanoverean horses had long served together during the Peninsular war, in the German brigade of artillery. They had assisted in drawing the same gun, and had been inseparable companions in many battles. One of them was at last killed. After the engagement the survivor was picketed as usual and his food brought to him. He, however, refused to eat, and was constantly turning round his head to look for his companion, sometimes neighing as if to call him. All the care that was bestowed on him was of no avail. He was surrounded by other horses, but he did not notice them. He shortly afterward died, not having once tasted food from the time his former associate was killed. "He died broken hearted."

Oswald tells how a troop "obtained its own again:" . "After a certain engagement the troop horses of friend or foe got mixed together, and, as a rough method of recovering his own, the commander-in chief ordered the whole to be kept without water for forty-eight hours. Then they were let loose, and, with their keen scent, galloped straight for the nearest drinking place. At this moment the trumpeters were ordered to sound the assembly call, and almost every one of the horses of the troop stayed his course toward the river bank and came trotting back in obedience to the well-known summons."

During a fox hunt an officer who made one of the party thought he recognized some horses in the field as having belonged to his own company. Wishing to be quite certain, he suddenly shouted: "Halt!" The word was productive of a magical effect. The suspected horses threw themselves back, plowed up a yard or two of soil with their feet, and when they recovered their position their riders were lying on the ground considerably in advance.

At the end of last century it was the

Digitized by Google

custom for the farmers' wives to attend Norwich Ped-market themselves, with butter, eggs, fowls and other stuff. One of these thrifty wives was complacently jogging along, seated between a pair of huge panniers, on a supposedly sedate old cavalry horse, who had a reputation for "freedom from vice." But on this particular occasion a corps of yeomanry cavalry were exercising in a field by which our good lady had to pass. The charge was being sounded. The old horse pricked up his ears, neighed delightedly, and in spite of all the remonstrances of the gentle rider, dashed into the field and took his station in the ranks to the infinite amusement of the gentlemen soldiers and the immense discomfiture of the fair equestrienne, whose smashed hopes—or rather eggs—were scattered in the erratic path of the animal who had responded only too promptly to the "imperative call of duty."

As Sentinels.—Horses have faculties more keen to dangers than man. We are told that horses can hear deep sounds which we can not. "For days previous to the earthquake in the Riviera the horses showed every symptom of abject fear, which continued without any change of character till the fury of the convulsion broke forth. But not till a few seconds before the earth began to quake did human beings hear any sounds, while it is extremely probable that the horses heard the subterranean noises for two or three days previously." Horses, too, "will scent danger before a man with his ear on the ground can hear the slightest sound of an approaching footstep. The Cossack rangers habitually take their ponies on picket duty and more than one of our western scouts owes his life to the timely snorting of his horse."

The Ruling Passion in the Hunter.—Lawrence tells of a particular mare of his which was one of the highest leapers in the neighborhood, and so attached to the sport that seeing the hounds pass her paddock she took a leap of pointed paling of considerable height and landed in a descent by the side of a well; whence, galloping up at full speed she joined the huntsman, kept him company through a long chase, and was in at the death of the fox.

Youatt writes: "It is beautiful to watch the old hunter, who, after many a winter's hard work, is turned into the park to enjoy himself for life. His attitude and his countenance when, perchance, he hears the distant cry of the dogs, are a study. If he can, he will break his fence, and over hedge and lane and brook follow the chase and come in first at the death. A horse that had a short time before been severely fired on three legs, and was placed in a loose box with the door, four feet high, closed, with an aperture over it a little more than three feet square, standing himself nearly sixteen hands, and master of fifteen stone, hearing the cheering of the huntsman and the cry of the dogs at no great distance, sprung through the aperture without leaving a single mark on the bottom, the top, or the sides."

The cry of the hounds has a powerful effect on a horse that has been accustomed to the chase. In 1807, when the Liverpool mail was changing horses at the inn in Monk's Heath, the horses that had just performed the stage having then only been taken off, Sir Peter Warburton's foxhounds were heard in full cry. With their harness on the horses immediately started after them, and followed the chase to its termination two hours after they had joined it.

A shooting pony—a Shetland—has been known to stop in the same manner as a dog does when it feels the scent of game, and to follow the keeper, till he raised a covey of partridges. The *American Field* published some short time ago an interesting account from a correspondent of a horse that had exhibited the same faculty in the field.

The following naturally follows the above: One morning, while out gunning, Mr. Peter Smith of Philadelphia, and a friend were sauntering down a mountain road, while Diamond, their horse, was left to follow with the buggy at his leisure. He was perhaps a hundred yards behind us, when he suddenly stopped, threw up his head and neighed. As he refused to come on when we called we walked back to see what could be the matter, and there, lying on the road before him, was a small package which the horse's owner had dropped from a pocket in pulling out

Digitized by Google

his handkerchief. When the package was picked up the horse followed on without any further hesitation.

The Horse as a Life Saver.—Prof. Claypole, of Antioc college, Ohio, relates as follows: A friend of mine is employed on a farm near Toronto, Ontario, where a horse belonging to the wife of the farmer is never required to work, but is allowed to live the life of a gentleman for the following reason: Some years ago the lady above mentioned fell off a plank bridge into a stream where the water was deep. The horse, which was feeding in a field close by, ran to the spot and held her up with his teeth till assistance arrived, thus probably saving her life. Was this reason or instinct?

Professor Kruger, of Halle, tells the following remarkable story illustrating the sagacity of the horse in this direction: "A friend who was one dark night riding home through a wood had the misfortune to strike his head against a branch of a tree, and fell from his horse stunned by the blow. The horse immediately returned to the house they had left, which stood about a mile distant. He found the door closed, the family having retired to bed. He pawed at the door till one of them, hearing the noise, arose and opened it, and to his surprise saw the horse of his friend. No sooner had the door been opened than the horse turned round, and the man, suspecting there was something wrong, followed the animal, who led him directly to the spot where his master lay on the ground still in a faint."

A Horse "Calls the Turn" on His Driver.—Mr. Smiles in his "Life of Rennie, the Engineer," tells a most amusing story to this effect: A horse called Jack was one among many employed at the erection of Waterloo bridge. The horse was accustomed to draw the stone trucks along a tramway to the place where the stones were required. A beer shop was, of course, opened near the works for the special use of the "navvies." The driver of Jack's truck was an honest sort of a fellow named Tom, who had one particular, but not peculiar, weakness, an inability to pass the beer shop without taking "just a little." Jack was so accustomed to this that, though a restive animal, he waited contentedly till Tom came out of his own accord, or till the appearance of an overlooker startled the man into activity. On one occasion, however, when the superintendents were absent, Tom staid so long at the ale tap that Jack became impatient, and, the trace fastenings being long enough, the animal put his head inside the beer house door, and seizing the astonished Tom by the collar with his teeth, dragged the lazy man out to the truck. Every man who witnessed the incident understood the action of the horse, and great became the fame of Jack.

The Horse and the Farrier's Shop.—Stories are numerous and authentic of the horse on losing a shoe or shoes proceeding to his accustomed shop to have his feet re-shod. We recommend these to those who are crusading against shoes for the hoof of the horse. The horse eloquently confounds the wisdom of those indiscriminative patrons of the S. P. C. A. We do not think it necessary to quote instances of horses going of their own instruction to the farrier's shop to be shod. The following, however, exhibits an even higher order of intelligence:

Bayard Taylor records this: In company with a friend I was driving along in a light, open buggy. I paid no attention to the horse, for he could turn, back or execute any maneuver in harness as well without as with a driver. Halting at a house where my friend wished to call I waited for him outside. Presently the horse looked back at me, twisting his body between the thills in a singular fashion. Perceiving he had some communication to make, I said: "What is the matter now, Ben?" Thereupon, by twisting a little more, he managed to hold up his right hind foot, and I saw that the shoe had been lost. "That's right," I said, "you shall have a new shoe as soon as we get to the village." He set down his foot, and for a moment seemed satisfied. Then the same turning of the head and twisting of the body were repeated. "What, Ben, is anything else the matter?" I asked. He now lifted up the left hind foot, which was still shod. I was quite at a loss to understand him, and remained silent.

Digitized by Google

He looked back at me out of the corner of his eye, and evidently saw that I was puzzled, whereupon he set down his foot and seemed to think. Almost immediately he lifted it up again and shook it vigorously. The loose shoe rattled. There was a positive process of reasoning in this act, and it is too simple and clear to be interpreted in any other way.

A cart horse belonging to a gentleman of Glasgow had been several times afflicted with the botts, and as often cured by a certain farrier. After a considerable interval the disorder returned while the animal was employed in a street nearly a mile distant from the farrier's shop. When seized with the disorder he was arranged in a row with other horses engaged in the same work. The carters being absent, he left the other carts, and, unattended by any driver, proceeded directly to find out the farrier's shop, which was difficult for even a man to find from that side of the town. Being unaccompanied it was surmised that he had been seized with his old complaint. When unyoked he lay down and showed by every means of which he was capable that he was in distress. He was again treated as usual and sent home to his owner. In the following case the horse discovering the same sagacity, was unfortunately not so well rewarded. A horse whose stable was situated about a quarter of a mile from Dundee, had been for several years regularly shod at one shop, and had also there undergone several surgical operations. Years having incapacitated the animal from executing his wonted tasks, his master had humanely tended him during the winter, hoping that spring might bring fresh vigor to his feeble limbs. Some time after the workmen at the shop were surprised by a visit from their old patient without any attendant. The afflicted brute actually stood before his former human benefactor, and commenced licking and biting his own sides, accompanying the action by a low moaning as indicative of some severe internal commotion. Unfortunately, however, his dumb eloquence was lost on the person he was appealing to, who, man though he was, being unable to conjecture what the animal could mean, shifted his place. His humble petitioner still following him, met with quick rebuff, and was at last dismissed. Foiled, the distressed creature returned as he came, lay down in his stall, and in less than fifteen minutes expired. It was found that in the agonies of death he had broken a strong rope by which he had been fastened, and disposed of the stable door, before he got out in search of that relief that human intelligence was unable to divine. Here the brute had more intelligence than the man.

Premeditated, Surely.—"I have often remarked," says Prof. Hennings, "that when I wanted to ride through water where the bottom could be seen the horse went without any hesitation, but when the water was muddy he shrank back, tried the bottom with one foot, and, in case he found it firm, advanced the other after it; but, if at the second step he took he found the depth increase considerably, he went back. Why did he act in this manner? Certainly for no other reason than because he supposed the depth would increase still farther and be attended by danger. Did not the horse, then, act upon premeditated grounds?" That, we imagine, was his intention in this case, certainly.

Mr. W. S. Bellows records an interesting case: "When a boy, being at Whitechurch, near Blandford, I noticed two cart horses that were sent from a farm yard to drink at a neighboring brook. The brook proved to be frozen over, so one of the horses struck the ice with his foot to break it, but it was hard and did not yield. The two horses, then, standing side by side, lifted each a foot simultaneously, and, making their hoofs descend together, the double blow broke the ice. Men could not have acted better."

During the winter a large, wide drain had been made, and over this strong planks had been placed for a cart horse to pass over to his stable. It had snowed during the night and had frozen very hard in the morning. How he passed over the planks on going out to work I know not, but on being turned loose from the cart at breakfast he came up to them and I saw his fore feet slip. He drew back immediately, and seemed

Digitized by Google

for a moment at a loss how to get on. Close to these planks a cart-load of sand had been placed; he put his fore feet on this and looked wistfully to the other side of the drain. The boy who attended this horse and who had gone round by another path seeing him stand there called him. The horse immediately turned round and set about scraping the sand most vigorously, first with one hind foot, then with another. The boy, perhaps wondering what he was premeditating, waited to see. When the planks were completely covered with sand the horse turned round again, unhesitatingly walked over and trotted up to his stable door.

Edward Jesse gives the next case we have: "Several bullocks having been put up for fattening in Kent, a boy was employed to carry the oil cakes to the place where they were tied. In doing this he had to cross a field where a pony was at grass, and one day, by accident, dropped a cake. On his return he intended to have picked it up, but it was not to be found. The next day, as he was passing through the field he was alarmed by the pony galloping furiously up to him, making at the same time some unusual neighings. The boy ran away and got over a hedge, when the pony showed evident symptoms of anger, though he had been up to that time uncommonly gentle. Some days afterward the pony got the boy into a corner of the field, darting his head at him and kicking out, but not doing him any harm. The lad was, however, so frightened that he dropped the oil cakes, one of which was picked up by the pony, who galloped off with it. He afterward made so many attempts of the same kind in order to indulge his partiality for this particular nutriment that it was found necessary to have it conveyed by another route."

Old Bill was a car horse and was used in common with many others to assist the heavily-laden horse cars up a steep street in a large city. The horses stood in line along the curbing at the foot of the hill. When a car came the front horse was hitched to it and assisted it up the hill, where he was detached, brought back and took his place at the foot of the line. Bill had served years at this and his years made him wise. When the drivers were not looking when Bill's turn came he would quietly walk back and take his place at the bottom of the line. He was seen to do this many times.

In Relation to Other Animals and Themselves.—The mutual attachment of animals of a different genus, when placed in a state of society, has often been remarked. Thus there was a reciprocal affection of many years' standing between the Godolphin Arabian and a black cat. In Stubbs' famous picture of the horse the portrait of the cat is introduced. Poor puss would not long survive her friend. She placed herself, seemingly, in a mournful attitude upon his dead carcass, where she remained fixed until it was removed from the building, then followed it to the place of burial, under the gateway, near the running stable, sat upon it whilst it continued above ground, and afterward crawled slowly and reluctantly away and was never seen again until her dead body was found in the hay loft. This feline used to sit on the equine's shoulder, or "cuddle doon" close to him when he took his reclining ease. What a pity that all such "energy" is dissipated by death?

A cat belonging to the royal stables at Windsor made herself so agreeable to one of the horses there that rather than put her to any inconvenience the horse would take his night's rest standing. This was held to be detrimental to his health, and the stable authorities, unable to hit upon any other plan, banished poor pussy to a distant part of the country.

Mr. Huntington, of East Bloomfield, N. Y., owned a thoroughbred horse named Narragansett, and a white cat. The latter was wont to pay a daily visit to the horse's stall, to hunt up mice, and then to enjoy a quiet nap. Mr. Huntington removed to Rochester with his family, leaving the cat behind. But the cat complained so loudly and so long that she was sent on to the new abode. Her first object was now to get somebody to interpret her desires. At last the master divined them and started off with her to the barn. As soon as they were inside the cat went to her friend's stall, made herself a bed near his head and

Digitized by Google

curled herself up contentedly. When Mr. Huntington visited the pair next morning, there was puss, close to Narragansett's feet, with a family of five beside her. The horse seemed to know all about it and that it behooved him to take heed how he moved his feet. Puss afterward would go out, leaving her little ones to the care of her friend, who would every now and then look to see how they were getting on. When these inspections took place in the mother's presence she was not at all uneasy, although she showed the greatest fear and anxiety if children or strangers intruded upon her privacy. When the horse was going to have his oats he always took up the cat gently by the skin of her neck and deposited her in the next stall, that she might not interfere with his feeding. At all other times he seemed pleased to have her near him.

Dr. Smith, a practicing physician of Dublin, had no other servant to take charge of his horse while at a patient's door than a large Newfoundland dog, and between the two animals a very good understanding subsisted. When he wished to pass to another patient without remounting, he had but to give the signal to the pair, who followed him in the most perfect good order. The dog also led the horse to water, and would give him a signal to leap over a stream. While performing this on one occasion, the dog lost hold of the reins, when the horse, having cleared the leap, trotted back to the dog, who resumed the reins.

Mr. Gilbert White, in his classic "Natural History of Selborne," mentions a curious fact in regard to a friendship between a horse and a hen. The two spent much of their time together in an orchard. The fowl would approach the equine with notes of complacency, rubbing herself gently against his legs, while the horse would look down with satisfaction, and move with the greatest caution and circumspection, lest he should trample on his confiding companion.

A pair of carriage horses, taken to water at a stone trough standing at the time at one end of the Manchester Exchange, were followed by a dog who was in the habit of lying in the stall of one of them. As he gamboled on in front he was one day suddenly attacked by a mastiff far too strong for his power of resistance. It would have gone hard with him but for the unlooked-for intervention of his stable companion. The latter, breaking loose from the man who was leading him, made for the battling dogs. With one well delivered kick he sent the mastiff into a cooper's cellar, and then quietly returned to the trough and finished his drink.

A horse of the common cart-horse breed, that used to work on the railway at Oxford, was always trusted by his master to return home unaccompanied after his day's work was done. The signal for departure was given to him by throwing the end of his chain upon his back. He would then start out and walk home invariably very deliberately. At one time an epidemic of keeping goats prevailed at Oxford. As our friend was returning home, the unwonted sight of a goat walking about in the streets, nodding its bearded horned head and perhaps blatting capriciously, immediately caught his attention. He at once proceeded to investigate the strange appearance. He walked over to the goat and subjected it to a thorough inspection, and it was not till he had surveyed it from all possible standpoints and even gravely drove it before him for a few hundred yards that his mind was placed at rest. After this the sight of goats never disturbed his equanimity.

"An amusing instance of practical joking," as it was called, in a dray horse occurred in the fifties in the yards of Messrs. Meux & Co., brewers, London. There was in the brewhouse yard a particular breed of pigs, to which one of the dray horses took a great dislike. This horse displayed this in a ludicrous way. He would "drop some oats out of his mouth," and when one of those pigs approached to pick them up he would seize it by the neck with his teeth and souse it into the large water trough set there for the use of the horses. He would then with the greatest glee caper about, shaking his head and exhibiting all the signs of exultation at his feat. This was so

Digitized by Google

often repeated that when any pig-squealing was heard the men would exclaim, "There's that —— horse at it again," and would run to rescue piggy from its precarious predicament.

A farmer's boy had fed and taken care of a colt. He was working one day in a field and was attacked by a bull. The boy ran to a ditch and got to it just as the bull came up to him. The animal endeavored to gore him, and would probably have succeeded had not the colt come to his assistance. He not only kicked at the bull, but made so loud a scream, for it could be called nothing else, that some laborers who were working near the place came to see what was the matter, and extricated the boy from the danger he was in.

The notorious Chillaby savagely tore in pieces the figure of a man purposely placed in his way. He could only be approached by his particular groom. This "mad Arabian," however, could "lay down" with a lamb, which reciprocated this friendship by butting away the flies from the horse. Mr. O'Kelly's Dungannon also had a friend in a lamb.

A horse that had a particular antipathy to strangers, while bearing his master home from a convivial party, became disburdened of his rider, who, not secure of his equilibrium in his equitation, preferred a brief indulgence of repose on the ground. The horse did not scamper off, but kept faithful watch by his prostrate master till the morning, when the two were discovered by some laborers not long after sunrise. The latter approached with the intention of replacing the gentleman in the saddle. But every attempt they made was repulsed by the grinning teeth and ready heels of the horse, who would not allow himself to be seized till his master awoke. The same horse, among other bad propensities, constantly resented the attempts of his groom to trim his fetlocks. This fact had been mentioned in conversation, during which the youngest "hopeful" of the family, only a few years old, was present. His owner had defied any man to perform the operation singly. The father the next day in passing the stable was horrified to see his infant son among the horse's legs busy with a scissors, trimming the fetlocks of the vicious beast, an operation which had formerly always to be performed by a number of men. In the present state of affairs the horse was looking on admiringly and complacently at the little groom, who was so calmly amusing himself. Shortly, to the great relief of the father, the precocious horseman came forth from the dangerous position, smiling at his father's alarm.

Bayard Taylor, whose interesting article in the *Atlantic Monthly* of February, 1877, we have quoted from, also says therein that the affection and fidelity of the horse have always been admitted. "When a boy of fourteen I was walking along a lonely country road with a companion of the same age, and came upon an old gray horse standing in the middle of the track over a man who was lying upon his back. We hastened up to give assistance, but presently saw that the man instead of being injured was simply dead drunk. He had tumbled off on his way home from the tavern and a full bottle of whisky, jolted out of his pocket by falling, lay by his side. The fore feet of the horse were firmly planted on each side of his neck, and the hind feet on each side of his legs. This position seeming to us dangerous for the man, we took the animal by the bridle and attempted to draw him away, but he resisted with all his strength, snorting, laying back his ears and giving every other sign of anger. It was apparent that he had carefully planted himself so as to completely protect his master against any passing vehicle. His act not only indicated affection, involving a sense of duty, but also more than one process of reasoning."

In 1734 the horse of a nobleman in Ireland ran at a man, seized him with his teeth by the arm, which he broke, then threw him down and lay upon him so that every effort to get him off proving unavailing they were forced to shoot him. The reason assigned for this ferocity was that he had been castrated by this man some time before, an injury that the animal apparently remembered and relentlessly resented.

A person who resided near Boston

Digitized by Google

was in the habit, whenever he wished, of catching his horse while the animal was grazing in the field by presenting him with a quantity of corn in a measure. When called on the horse would come up and eat the corn, thus affording his master an opportunity of putting the bridle over his head. But the owner having deceived the animal several times by calling on him when he had no corn in the measure, which he held out as if it were full, the horse began to suspect his design. Coming up one day as usual upon being called he looked into the measure and perceiving it was empty reared on his hind legs and killed "his master" on the spot.

Bayard Taylor's horse that lifted up his feet, that we have mentioned, had a playful habit of snapping at his master's arm when he was harnessed for a drive. "Of course, I never flinched, and his teeth often grazed my sleeve as he struck them together. One day, more than a dozen years ago, he was in rather reckless spirits and snapped a little too viciously, catching my arm actually in his jaws. I scarcely felt the bite, but I was very much surprised. The horse, however, showed such unmistakable signs of regret and distress that I simply said: 'Never do that again.' *And he never did.* From that moment he gave up the habit of years. He laid back his ears or feigned anger in other ways, but he never again made believe to bite."

Lord Anglesey's General Hess never, if he could help it, would allow Sam Rogers to approach him. This horse was found one morning all huddled up in the corner of his box, shaking from head to foot, in a black sweat, with his stable attendant lying dead on the straw behind him. This was taken as an evidence of remorse, and there were friends, therefore, to condone the deed, the presumptious proof of his guilt being so clear. The assault of Muley Edris on Archer was supposedly prompted by a similar spirit of revenge.

A gentleman in Suffolk had an excellent hunter, of so strong and well compacted and developed frame that it seemed as if the animal could never be tired. It appeared as fresh when it returned from a day's sport as when it went out. One day his master, from some caprice, vowed that he would tire the horse. He rode him, accordingly, through plowed fields and all manner of difficult ground till the animal plainly showed himself at the end of the course dead beat. He was handed over to the groom, and suffered himself to be led off quietly to the stable, as usual. The next morning when his master went to see how he was he burst from his stall with the utmost fury, breaking the halter with which he was fastened, and attacked him with his feet and teeth so violently that he would have been quickly killed had not the groom and some other attendants rescued their unfortunate master.

It is well known how thoroughly racers enter into the spirit of the course. Forrester presented a noble illustration of this. He had won many a hardly contested race, but in an evil hour was matched against an extraordinary horse called Elephant. It was a four-mile course, and at the distance post the horses were nose to nose. Between this and the winning post Elephant got a little ahead. Forrester made every possible effort to recover his lost ground, until, finding all his efforts ineffectual, he made one desperate plunge, seized his antagonist by the jaw, and could scarcely be forced to quit his hold. In 1753 a fine horse belonging to Mr. Quin was rendered so frantic at finding his antagonist gradually passing him that he seized him by the leg. Both riders were obliged to dismount and combine their efforts to separate the animals.

In the Italian races run by riderless horses in long alleys, the horses have girths round their bodies to which are attached loose straps with balls of lead at the end of them, armed with steel points for the purpose of spurring the animals, the running putting the straps in motion. The horses in their wild career often show emulation or spite, by catching or biting at one another when they are afraid of being left behind.

Some interesting facts have been brought out by the "black brigade," or funeral horse industry, of London. If a colored horse is put on one of the stalls, the rest of the horses in that stable will at once become miserable and fretful.

Digitized by Google

The experiment has been tried over and over again, always with the same result. They are all very intelligent and get to know the cemetery roads, and in coming into them fall into a proper pace of their own accord. It takes a great deal of experiment before each horse finds its most companionable mate.

We may turn from such instances to some of more evident affection. There is a pathetic story about High Tariff, the colt that fell dead in the race for the American Derby at Chicago last year, and Poet Scout. "The latter was to make the running for High Tariff, which he did, but High Tariff fell dead at the end of a mile, and Strathmeath won the race. Poet Scout and High Tariff were nearly full brothers in blood, and were never separated from the time they were weaned. They ran in the same lot and were kept in adjoining stables, with a board removed so they could see each other. In the evening after the race Poet Scout looked for his dead companion. He would not eat, but would walk around the stall and look out of the door. He whinnied all night, and for days would look in vain for his mate. When his feed was put in his box he would take a mouthful of oats and run to the door and whinny, but High Tariff never came. Poet Scout is a changed horse, and all connected with the stable say that he grieved as much as any human being ever grieved at the death of a brother." Many similar instances could doubtless be told. Filemaker and Roselawn are never happy unless together.

There is certainly great affection reciprocated between man and horse. The great Semiramis was in love with a horse. Sometimes the horse mourned for his master "even with tears." On King Nicomedes' death his horse starved itself to death. But we do not depend on those ancient, often apochryphal, accounts for proofs of such facts.

The Scythian cavalry was famous, and on one occasion when a chieftain was killed his horse fell with both "tooth and hoof" upon the victor and slew him. When Antiochus was slain the warrior who had killed him endeavored to ride his horse, but the latter threw him to the ground and he expired.

Equine Jealousy.—In a fashionable boarding stable in New York is a horse called Tatters. "Tatters belongs to a lady who makes a great pet of him, and never visits the stable without taking him some apples, carrots, or sugar, of which he is extravagantly fond. In a neighboring stall is the horse of her friend, an animal rejoicing in the name of Phil. Tatters and Phil are on good terms, but the former sometimes throws his ears back and manifests jealousy when his mistress, after giving him an apple or a carrot, gives one to Phil. One day she went into the stable while Tatters was in the hands of the groom. He began begging for an apple, and she deferred the gift until the groom had finished his work and the horse had returned to his stall. Meantime she gave the apple to Phil. When Tatters had gone to his stall she offered him an apple but he refused to take it, and turned his head from her in disgust. For half an hour she coaxed him, but to no purpose. Then the groom tried to induce him to take it, and then another groom made the same effort, but all in vain. Take the apple he would not, nor would he recognize his mistress in any way. His ears drooped, and he had the appearance of a child in the sulks, just as much as a horse could possibly have it. His heart was momentarily broken, not so much because an apple had been given to another horse, but because it had been given before he himself had received one. But by the next day he seemed to have forgotten his grievance, and you may be sure that his owner has been careful not to offend him since in the same way."

Some mares, particularly those of very sensitive organization, are excessively jealous of their offspring. Goldsmith Maid was one of that kind. It is related that when her first foal was brought forth she would allow no one to come near it. "One day Charley, her old attendant when she was in Budd Doble's stable, visited Fashion Farm. Charley and the Maid were once fond friends, and, to test the endurance of that friendship, Charley concealed himself near the doughty old mare and allowed her to hear his voice. The Maid was browsing in a paddock with her colt by her side. On hearing

Digitized by Google

Charley's voice she instantly raised her head, gave a whinny of delight, and with that bold, free, sweeping stride that in years gone by had electrified thousands, dashed about the paddock in search of her old friend. When Charley appeared she went to the fence over which he leaned, and showed her joy in every action. Not only did she welcome him, but invited him to fondle her baby. Round about the two she circled, uttering a low whinny which expressed a mother's pride and love. She pushed the colt up to Charley, smoothing its coat with her tongue, and asked him in the plainest horse language to admire it. It was a beautiful picture of confidence between man and beast. She knew Charley well, and had no fears for her youngster; but let any one else come near her and a pair of twingling heels warned him to keep his distance."

Solicitude for Young.—Mr. Watson mentions ("Reasoning Power of Animals") the following: "A gentleman was one evening in the full enjoyment of a pleasant dinner-party in his own house. It so happened that a glass door opened from the dining-room upon the lawn. Pushing open this door a most extraordinary and unbidden visitor entered the room. Starting up, the amazed company beheld a quadruped which had never entered that room before. The host advanced and recognized one of his favorite mares, which, undaunted by the blaze of light and the crowding round of the astonished guests, showed by voice and manner some strange emotion. The master went up to the animal, which trotted off, uttering a peculiar cry. It was determined to ascertain the cause of the mare's strange conduct. She was followed to a field, where the motive of her unwonted behavior was quickly ascertained. Her foal had got entangled in bog and briars, and the alarmed mother had adopted this effective mode of obtaining aid."

It is related that in the month of April, 1794, owing to a strong wind blowing contrary to the current of the river, the island Kroutsand, surrounded by the two branches of the Elbe, became entirely covered with water to the great alarm of the horses, which with some foals, had been grazing on it. They set up a loud neighing and collected themselves together in a small space. To save the foals that were now standing up to their bellies in water, seemed to be the object of their consultation. They adopted a method at once ingenious and effective. Each foal was arranged between two horses, who pressed their sides together so as to keep them wedged up, and entirely free from injury from the water. They retained this position for six hours, nor did they relinquish their burden till the tide having ebbed and the water subsided, the foals were placed out of danger."

Mr. Strickland relates that a mare had her first foal when she was ten or twelve years old. She was blind of one eye. The result was, she frequently trod on the foal or knocked it over when it happened to be on the blind side of her, in consequence of which the foal died when it was three or four months old. The next year she had another foal, and it was fully expected the result would be the same. But no; from the day it was born she never moved in the stall without looking round to see where the foal was, and she never trod upon it or injured it in any way. "Reason did not teach her that she was killing her first foal; her care for the second was the result of memory, imagination and thought after the foal was dead, and before the next one was born."

Gall tells us of mares which have such a passion for colts that they have kidnapped foals from other mares and took care of them with jealous fondness. Aristotle noted that the horse was an animal to be extremely fond of its young. Thus when mares have lived together, if one dies the rest cherish its foal. Often the barren ones themselves do so, but by reason of having no milk the foals consequently die.

F. L. Harvey published the following in *Science*, Vol. III., p. 672: A colt two years old lost its mother. Previous to her death the mare was covered with a blanket. When it was apparent she could not live, the blanket was thrown over the fence. The mare was removed and the colt left in the enclosure. The colt was very much exercised at first. He ran up and down the yard neighing.

Digitized by Google

When it came near the blanket on the fence it stopped, smelled it, and seemed pacified. It continued so. If the blanket was removed from the fence the colt became restless and went about neighing; but was always reconciled on the reappearance of the blanket. When one threw the blanket over his back the colt followed the bearer all about. It would graze in the vicinity of the blanket, and would never go far away. When it wished to rest it went and lay down beside it.

Effect of Habit.—The effects which the parents' habits have on their unborn offspring is very extraordinary. An instance may be here described. In breaking in a mare, which was afterward found to be in foal, it was necessary to lunge her frequently in a circle. When the foal was born and was strong enough to do so, it began to move round and round incessantly and continued the practice for a considerable length of time. Oswald gives an account of the Mexican horses which have been employed to work the irrigation mills. When spavined and worn out they are turned upon the prairies to recover or die. The habit of walking round has become established in some of these worn out animals that after being months at liberty they may be seen "going the mill track" by the half-hour at a time, as if unable to resist the acquired habit. The same could be paralleled in man.

The following story told by Charles Darwin, shows how habit may be perpetuated by the action of other senses:

"Many years ago I was on a mail coach, and as soon as we came to a public house the coachman pulled up for the fraction of a second. He did so when we came to a second public house, and I then asked him the reason. He pointed to the off-hand wheeler, and said that she had long been completely blind and she would stop at every place on the road at which she had before stopped. He had found by experience that less time was wasted by pulling up his team than by trying to drive her past the place, for she was contented with a momentary stop. After this I watched her, and it was evident that she knew exactly before the coachman began to pull up the other horses, every public house on the road, for she had at some time stopped at all. I think that there can be little doubt that this mare recognized all these houses by her sense of smell."

Katie W. Sherman (*Science News*, March 8) wrote: "I saw a horse the other day behave very much like a small boy. A procession was passing in a neighboring street, and the horse being unfastened, his attention being drawn to the music of the band, he solemnly walked to the corner of the street, and watched the procession go by."

The following may be called purely instinctive: When horses are out at pasture and resort as they continually do to the shade of some umbrageous tree, they may often be observed at such times standing parallel to one another. But their heads are in opposite directions. By this mutual arrangement they can with their tails brush the flies from each others' faces.

It is well known that in hot countries where the blood of horses is heated by the climate, they are in constant habit of bleeding each other and sometimes themselves affecting this surgical operation with their teeth.

Bearing in mind the "nearness" of the tapir to the horse, it was curious to read in an interesting account (*American Field*, February 13) of hunting the tapir the following: "I was surprised to see an animal so like a pig as the tapir is, fighting much as a horse might, under similar circumstances."

Use of Heels.—The horse has indeed long learned, and from its actions originated the proverb, to "make its heels its friends," in more ways than in speed. The horse Baiardo, in Ariosto, fought the enemy with his feet. There is a wonderful story told of an entertainment gotten up specially by King Frederick of Prussia in honor of the no less great duke of Marlborough. A horse and bull were turned into an enclosure. Then a lion, a tiger, a bear and a wolf, which had been kept hungry for the occasion, were turned into the ring. Attention was, for the nonce, absorbed by the bull. The struggle resulted in the wolf and tiger first falling dead or dying. The tussle between the bear and the lion was

Digitized by Google

prolonged, but at last the bear got the lion at an advantage and sweetly hugged the life out of him. The horse had quietly regarded the life and death struggles from the commencement, and now the bear, seeming to think the horse was rather too disinterested in matters, prepared to attack the latter. The horse waited, and, watching his opportunity, gave the bear a welcoming broadside in the ribs from his heels, which sent the ursine opponent reeling. Coming up "smiling" the latter got a second well directed application from the horse on the head, jaws and other accommodating parts until he was rendered perfectly *hors de combat*. The horse then went quietly to grazing, as he had been doing up to the time of attack—so unconcerned in the laurels he had won as to fill the spectators with admiration.

Rudyard Kipling's description—his first literary success—of an entertainment given by the Maharaja of Kashmir, is given in Lockwood Kipling's work, which has been already quoted in these columns: "Certain vicious shrieks and squeals gave evidence that the horses were being got ready, and the police set about widening the ring. Presently a bay galloway and a black pony danced out, dragging their attendants along with them at the end of a long rope. The instant they were let go they ran open-mouthed at each other, then turned tail to tail and kicked savagely for five minutes, the black suffering most. Then, after the manner of horses the world over, they turned round and closed, each striking with his fore feet and striving to fix his teeth in the other's crest. They squealed shrilly as they boxed, and finally rose on end—a magnificent sight, locked in each other's arms. The bay, loosening his hold on the black's poll, made a snatch at the black's near fore-leg, which was at once withdrawn. Both then dropped to the ground together and kicked and bit, at close quarters, till the bay fled with the black after him through the crowd. Horses fight like demons, with keen enjoyment and much skill."

The following has recently been published on undoubted authority: "In the neighborhood a few miles east of Galiad, Tex., a Mexican pony is the hero of the hour. The pony, which is a very small one, was bought by a farmer, James Lester, several years ago, and has since then been the constant companion of the Lester children. They have ridden San Jose, rolled over him and pulled his ears and tail, and have always considered him as one of the family. When the children went on any expedition where they didn't care to ride, San Jose generally went along anyhow, as naturally as though he had been a pet dog, and on the few occasions when his liberty was restricted, and he was tied up by the head while the children went visiting, he sung melancholy hee-haws until the family were only too glad to turn him loose. One day not long since, however, three of the children went on a nutting expedition, and the two little girls rode San Jose, while the brother walked beside him. Arrived at the point where nuts were most plentiful, San Jose was turned loose to wander about and graze at his will until the time should come for returning home. The children worked steadily for several hours, and then the boy went on to a tree some distance away, leaving his sisters to rest where they were. He was fully out of sight, and the little girls were walking about, side by side, exploring the ground to see if any nuts had been left. Suddenly, almost beneath their feet, sounded an ominous whirr, and there was a coil of a huge rattlesnake, with his wicked head reared from the midst and drawn slightly back, ready to strike. Neither child moved an inch. Each said afterward that she could not have moved—that she felt as though she were frozen stiff. But suddenly, while the deadly head went waving back and forth, there was a quick trample of hoofs, a rush through the bushes and San Jose leaped into the ring. With his four little sharp hoofs brought together he shot up into the air, landed square on the snake's coil and was off again before the wicked head could strike. The interruption had released the frightened children from the rattler's influence, and they ran a short distance away and stopped to witness the fight. The rattler was wounded, but in an instant it resumed its coil and its offensive attitude, and the children be-

Digitized by Google

gan to think it was all over with poor San Jose. But no! He came again with that sudden spring with all four of the little hoofs straight upon the snake's body, and this time the body was cut half in two in one place and was wounded in several others. The snake writhed and twisted, and in the midst of its contortions bit itself again and again. There was no more fight in it. It tried to crawl away, but San Jose leaped upon it and trampled over it until it lay quivering on the ground. San Jose was still doubtful about it and pawed it over with one fore foot, after which he smelled it over carefully. Being thoroughly satisfied that it was dead, he shook his head jauntily, sung a melodious solo, and went on grazing."

The French general, Marbot, had a "vicious" mare that he rode, which destroyed two of his assailants in action with his teeth and heels, and then carried him through a hot fire to safety.

Lieutenant Robertson, of the British service, had a horse that acted similarly. But it is not right to call such action vicious. The horse knew his master was in danger and defended him. When a murderous attack was made on the lieutenant by a young Ghazi, he fell from his horse bleeding profusely from his wounds, and the Ghazi came up to finish him, the faithful horse turned his heels to the enemy and lashed out at every attempt made to approach the wounded officer. This he did till help was at hand or the assailant fled. Thus the life of the lieutenant was saved.

A singular character trait, remarks Oswald, of all animal renegades is their hostility toward their servile relatives. Travelers on the Rio Grande have to be very careful in picketing their saddle-horses, for if they stray into the prairie they are sure to be mobbed and cruelly kicked by the wild mustangs. On the other hand sometimes, as told us by Professor Wallace, of the wild horses in Australia, these will hang around the runs where the civilized horses are grazing and entice them away to liberty.

The Chinese Tartar ponies seem to be like some races of men, incurably vicious from our standpoint. Besides bucking, kicking and biting, they have acquired an accomplishment peculiarly their own —boxing. They stand on their hind legs and strike out with their fore ones. An eye witness of their actions says: "I saw one at Tienstsin which was incurable. I saw him knock over an ox and five Chinese horse-breakers in succession who tried to break him in. They united their efforts to master the pony, and three were seriously wounded before they gave them up." These ponies are no less tough on the road. One carried an Englishman seventeen miles within the hour "pacing the whole way and never once breaking into a canter." These Chinese horsemen believe that a pony with a head like a mule is to be preferred.—*Live Stock Journal.*

Curious Food Partialities.—Bucephalus, in the legend of Alexander of Macedon, fed on human flesh. According to Herodotus, the horses belonging to the lake dwellers of the Pœonians were fed on the fish from the lakes below the pile dwellings.

William Prettyman, a farmer in the outskirts of Bristol, Pa., is the owner of a horse which has renounced its fondness for hay and oats and prefers a diet of meat and vegetables, with so little care as to the quality of the strange diet that it can now be kept in good condition at a weekly cost of a trifle over $1, while its regular keep when it fed as other horses do involved the spending of more than twice that amount. Any old vegetables, potato peelings, turnip tops or other dainties of that nature, together with chopped salt pork or salt beef, are greedily devoured by the animal. The horse has improved in weight, strength and speed. The farmer hopes to induce all his live stock to alter their diet in the same way, but thus far has not succeeded in convincing any of them as to its attractions.

Oswald tells the story of the carnivorous horse kept by the Guikowar of Guserat for fighting, who, when in the ring and baited with dogs, would not only kill his assailants but eat them afterward.

Sydney Smith, when at Foston, used to exercise his medical skill on the needy. On one occasion, wishing to administer a ball to a horse, which he had

Digitized by Google

called Peter The Cruel, the groom, by mistake, gave him two boxes of opium pills, which Peter complacently munched, boxes and all. The "Doctor," in dismay, on hearing this went to look, as he thought, for the last time on his beloved Peter. But he soon found that neither boxes nor pills had produced or did produce any effect, much to his relief.

The famous Bolton ass is said to have chewed tobacco and to have taken snuff. A mare living near Lake Ontario, on the Post Bay road, Canada, has acquired a discriminative partiality for tobacco. Her preference is for fine cut. She could consume two pounds at a time. Leaf tobacco, however, was too much for her. This habit was formed long before the birth of her colt, and it is stated that in the case of the youngster the appetite seems to have been inherited. The colt can consume even the leaf *ad libitum*. The animals thrive well on the occasional diet.

Bread has been an article of equine dietary from time immemorial. The famous pumpernickel is a case something analagous to Dr. Johnson's definition of oats. Boston beans baked into bread is a favorite horse "dish." But we know from a curious experience that however welcome the beans may become, so prepared, to the horse, he will not have them plain. He don't know beans, in such state, which shows he must be taught to eat them.

Reasoning in Animals Illustrated.—Goldsmith records that he had "seen a horse that would eat oysters." These food allusions have been by the way, but they allow us to conclude this article by quoting two anecdotes, relating to dog and man, which, though they have no direct bearing on "horse sense," strictly regarded, yet graphically illustrate the greater subject of the nearness of animals to each other. The first, relating the intelligence of an animal, the dog, is quoted from the *Revue Scientifique:*

"Hunting dogs, when they grow old, become rheumatic, or at least debilitated with pains. We know, too, that they crave heat and get as near the fire as possible—a craving which increases as they grow old. One such dog, older than the others and slower in getting into the lodge on returning from the hunt, was often crowded away from the fire by other dogs getting all the best places before him. Finding himself thus turned out in the cold, he would dash toward the door barking, when the others, supposing it was an alarm, would rush away, too, while the old rheumatic went to the fire and selected a place to suit him."

The second illustrates the intelligence of the animal, man, and is authentic:

"A funny story is told of Dean Swift, who was a witty man, and fond of a joke at the expense of other people, as most witty people are. One very cold night, when he was traveling, he stopped at a little inn. There was only one fire in the house, and the guests of the inn crowded about it. left no place for the new comer.

"With a solemn face Dean Smith called to the hostler, and told him to get a peck of oysters immediately and take them out to his horse.

"'Will your horse eat oysters, sir?' asked the astonished man.

"'Just take them out and see,' said the horse's master.

"The people around the fire stared at the man that owned this curious horse, and nearly every one of them left his seat and went out to see the remarkable horse eating oysters.

"Then the cunning Dean made himself comfortable in the warmest corner and ordered his supper.

"Presently back came the hostler, with the disappointed crowd after him.

"'He won't touch them, sir,' cried the hostler.

"'Then take the foolish animal all the oats he can eat,' replied Dean Swift. 'You can bring the oysters here. I'll eat them for supper myself.'"

In what respect did "the reasoning" in the cunning old dog and the no less cunning old dean differ?

THE ARAB TOP CROSS.

BY BADGER.

Every now and again in Britain some one starts out to try and improve the thoroughbred with the oriental horse, and the Arab maniac who would improve

Digitized by Google

our glorious trotter with top crosses of the blood of the horse of the desert is still abroad in the land and more pity is it that some of those mono-maniacs are trying to prove their faith in their works. How any man possessed of ordinary sense can believe that the little horse of the sandy desert can in any way improve the trotter is more than one can well see, for a low forehead, and an utter lack of speed, style, and substance are not qualities that go to make up a trotter of even the meanest calibre. But some there are who believe that by the use of the Arab horse as a top cross a new breed of trotters can be originated and perfected. One might almost think that with Nancy Hanks, Sunol, Palo Alto, Allerton, Axtell, Nelson and a host of others that it is not necessary to mention here, we have done pretty well amongst the trotters already, without even a mixture of a drop of the blood of the desert save that which has come down to these equine celebrities through their thoroughbred ancestors; but if we would believe some of the Arab maniacs we would soon have some even more doughty doers of even more doughty deeds if we were only to make use of the Arab blood.

What utter bosh it all is, this eternal harping on the great excellence of Arab blood. Because two hundred and fifty years ago the Arab horse improved in speed and endurance the then existing breed of galloping horses in Great Britain is it reasonable that we must throw to the winds all the most conservative breeders of England the more progressive breeders of America have done for us and go back to the creeping scrub of the Sahara?

And yet these lovers of the Arab would have us believe that we could get better horses by crossing the Arab into our best trotting pedigrees. As a trotter the Arab is a rank failure, the peculiarly level and sandy going of his native country having taught him to gallop and not to trot. The Barb has much superior trotting qualities to the Arab, the stony nature of the country from whence he hails rendering a gallop for the most part impossible. But as in England so it is in this country, every oriental horse is called an Arab, irrespective of his being of true Nejed stock, a Barb, a Persian or the veriest parish scrub of the many kinds and strains that, springing from the parent eastern stock have by habitat and circumstances developed into many separate breeds.

In Scotland, where I put in many years of my life, I had the privilege of seeing quite a number of oriental horses that were imported to that country by Sir Robert Jardine of Castle and his cousin Hon. John Johnstone of Halleaths, Dumfrieshire. At the latter place in all my earlier recollections I can not think of a time when an imported oriental horse did not stand for public service at the very low fee of three guineas or thereabout, and it is fair to say that no one ever thought of using any of these horses for any purpose but that of getting ladies pads or small phaeton horses. I remember once seeing a Barb, which I am free to say was the best oriental horse I have ever seen, standing in the stud court at Halleaths beside the noted sire of race horses, Tynedale, sire of the great runners Teviotdale and Reveller, and it was just like putting a fourteen-year-old boy beside a full-grown man, six feet four in his stocking soles broad in proportion. Tynesdale, though not one of the finest specimens of English thoroughbreds, was yet a fair individual and he so far overshadowed the little Barb beside him that no one thought of looking at the latter and one of the bystanders remarked, "What pony is that?" Some of these Barb colts were kept entire and bred to the ponies of the district at a fee of about 30 shillings or $7.50, which seems to be quite moderate when compared with what some of the owners of such half-bred screws in this country ask for their services. In all my experience in show rings, both on this side of the Atlantic and the other, I have never known a half-bred Arab take a prize in any of the prominent classes, though I understand that there are such cases on record, which, however, can be counted on the fingers of one hand. Seeing that the Arab can not trot a little bit, but can gallop after a fashion and stay over a distance of ground if he gets time enough to it, it is only fair to suppose that he would be more use in improving gal-

loping stock, if he were any use at all, than to improve trotting stock when he has no aptitude for that way of going. Now what are the facts regarding his improving the thoroughbred as perfected in England years ago and used for running purposes for many years practically the same as at the present day? General Angerstein spent many thousands of pounds and many of the best years of his life in trying to improve the thoroughbred by crossing mares of that kind with Arab studs. The whole fruit of his labor was the production of a lot of graceful little weeds up to nine stone at the outside and the biggest and best that he ever bred was picked up by some circus owners and afterward, we are told, became a most celebrated manage horse, which must be considered a somewhat doubtful honor after all. The Arab lacks size sufficient to make him useful, and when we consider that the prevailing cry in this country in all lines of horse breeding is for more substance, this one thing puts him out of court as utterly unfit to improve any of our breeds of horses. Regarding this matter we quote from Blackwood's magazine of 1859 in which an officer in the Crimean war recounts how he was sent to Syria to buy horses. After describing the manner of horse dealing prevalent amongst the Anajeh tribes he says: "The average height (of the horses bought) was fourteen hands one and a half inches and the commonest age four to five years; but this would be an over-estimate of both the height and age of the mass of Anajeh horses offered for sale, but we selected the biggest and oldest." From this then we may judge that the height given, fourteen hands one and a half inch, is rather over the average height of the Arab, and in the name of common sense what do we want with fourteen-hands-one-and-a-half-inch trotters? Lord Dufferin, when appointed governor-general of Canada, brought with him to that country an Arab stallion that he had purchased in India, and whilst there presented him to one of his aides-de-camp, who in turn sold him to a breeder of horses in Ontario. It appears that this last gentleman knew something of the Arab horse, for he bred this stud to full and half-bred Exmoor ponies with the result that he was able to place on the market a class of ponies about fourteen hands high at the tallest, showing a good deal of the quality of the Arab and with the peculiar carriage of the tail which is the chief charm of the Arab conformation. These ponies were broken, matched and sold with harness and carriage complete and in this way the whole outfit netted in extreme cases $500, which allowing for the cost of harness and vehicle can not leave very much for the ponies. This is about the most rational use to which I have ever heard of an Arab horse being put in this country, and only goes to show that the Canadian breeder was willing to profit by the experience of those who have tried Arab horses as sires in England.

In addition to this great and insurmountable fault of lack of size, the cat-hammed, calf-kneed, goose-rumped formation of the average Arab as seen in the east is sure to crop out in the progeny of even the best; for Arab stallions in common with English and American ones, do not get all their colts good individuals; in fact they, on account of the proclivities of the race mentioned get a larger proportion of real bad ones, what the late Harry Heiover would have called "good-for-no-purpose" ones than any other strain of horses existing at the present day, unless it be the Indian Cayuse, and then it would be about a stand-off, if the class of mares covered was exactly the same.

The few rare examples of good Arabs that have been brought to Europe are very widely different to the majority of what are called Arab horses, and it is almost impossible to get a native to sell a good one, so that something decidedly mediocre, even for an Arab, is taken, and a long price paid.

The best and purest of all the Arab horses, and indeed the only ones that should be dignified by that name, are those of the Nejed strain or breed which are to be found owned by the Wahabees in Nejed itself. Amongst authorities on this subject there seems to exist no doubt that the horses of the Wahabees are the best of all the oriental strains and animals of this type are rarely ever seen in

Digitized by Google

England or elsewhere. The Wahabees are the most bigoted tribe of Mohammedans, and there is only one instance recorded where an Englishman got amongst them, and he, taking his life in his hand, disguised himself as an oriental and went amongst them. In Cassel's Book of the Horse we find the following account of the animals he saw there: "Their stature was indeed somewhat low; I do not think that any came fully up to fifteen hands, fourteen hands seemed to be about the average, but they were so exquisitely well-shaped that want of greater size seemed hardly a defect. Remarkably full in the haunches, with a shoulder of a slope so elegant as to make one, in the words of an Arab poet, 'go raving mad about it;' a little, a very little, saddle-backed, just the curve which indicates springiness, without any weakness; a head broad above and tapering to a nose fine enough to verify the phrase of drinking from a pint pot, did pint pots exist in Nejed; a most intelligent, and yet a singularly gentle look; full eye; sharp, thorn-like little ear; legs, fore and hind, that seemed as if made of hammered iron, so clean, yet so well twisted with sinew; a neat, round hoof, just the requisite for hard ground; the tail, set on, or rather thrown out, at a perfeet arch; coat smooth, shining and light; the mane long, but not overgrown and heavy; and an air and step that seemed to say, 'Look at me; am I not pretty?' Their appearance justified all reputation, all value, all poetry. The prevailing colors were chestnut or grey, a light bay, an iron color; white or black were less common; full bay, flea bitten, or piebald, none. But if asked what are, after all, the special distinctive points of the Nejed horse, I should reply, the slope of the shoulder, the extreme cleanness of the shank, and the full, rounded haunch; though every other part has a perfection too, and a harmony unwitnessed, at least by my eyes, anywhere else."

Here then is what an eye witness says of the celebrated Nejed Arab, and the points he notes as most striking are the slope of the shoulder, the cleanness of the shank and the full rounded haunch. Continuing on in his description of what he saw in Wadi Haneefhan, Mr. Palgrave states "that he was repeatedly told that prolonged lists of pedigrees were never kept and that all inquiries about race are limited to the assurance of a good father and a good mother. "As for Salaman," added the groom, says Mr. P. "he is much more likely to have taken horses from us than we from him," which would seem to upset the theory propounded by the Bedouins and eagerly clutched by the Arab maniacs, both English and American, that the ordinary Arab horse as exported from eastern countries had a carefully kept pedigree extending for three or four hundred years back. If the best of the Arab horses—those which should only be dignified by the name—are not bred to line, nor their pedigrees even kept at all, it is not to be supposed that the ordinary scrub stock of the desert should fare any better in this respect.

Mr. John Johnstone who is referred to before in this article as keeping oriental horses for public service in Scotland, at one time wrote to the long since defunct *Sporting Magazine* a letter which embodied the results of some experiments with English and oriental horses at Aleppo, where he was stationed for some time. This letter is given in full in the work shortly before mentioned as containing Mr. Richard Palgrave's account of the horses of Nejed strain, and we give it in full, as it contains the most satisfactory information to be had on the subject.

"I have made five experiments in horses here (Aleppo). First. Out of thoroughbred English mares by Arabian stallions. Second. Out of the best Arab mares by thoroughbred English horses. Third. Rearing the best Arab blood on succulent forage, as in England. Fourth. Rearing thoroughbred English stock in the desert on dry food. Fifth. Buying colts and fillies superior to those usually sold by the Arabs.

"The first experiment has led to no great results; the produce being merely handsomer than English horses, without being faster than Arabs.

"The second experiment has succeeded occasionally, but out of four, three are leggy, weak, and unfit for racing.

"The third experiment is a complete failure, except in increasing the size. The produce has the defects of the English horse without having the merits of the Arab.

"The fourth experiment is perfectly successful; the stock, though smaller than their

parents, being better able to stay a distance. The heat of the desert; the dryness; the constant galloping (from their birth after their dams, and ridden by children from a year and a half); the camels' milk with which the Arabs feed their foals (and which they think impart the camel's endurance); the oxygenation of the blood by being always in the open air; the kind treatment (preventing bad temper, which impedes development); have all a great combined effect in bringing out the good qualities of a horse. A cubic inch of the tibia of a horse so reared weighs twenty per cent. more than stabled stock. I have now a colt out of Test by Touchstone, dam Tarella by Emilius, got by Chilton by Cowl, which I offered a few days ago, in the desert, as a present to any Arab who could catch him. They tried their best, but he ran right away from them. I must say, however, that there were none present of those superior Arabs which formed my fifth experiment. This fifth experiment is, in my opinion, the surest card of all. One has a great choice, and need buy nothing without speed and stoutness; whereas, breed what you like, more than half your young stock will never be racers. The fact is this, there is blood and stride in the desert which has never been seen out of it.

"The Indian market is supplied by the Aghel tribe, who go about the desert buying chiefly colts rather than fillies, never paying more than 5,000 piastres (£40), and sell them at a small profit to the great purchasers at Bagdad and Quaid, who pass them on after a year or two to the Bombay dealers. The Arabs will not give their best blood and figure at this price; in fact, as you will have found out by this time, it is difficult to get them to sell it at all. I am perhaps the only one who has succeeded. I help them in their business with the Turkish pachas, prevent oppression, enable them to trade in safety with English exporters of wool; and even after a deal of trouble on my part, I buy a first-class horse or mare from them as a great favor, and at a long price. I have just sold, for instance, two mares to the Emperor of Russia for £500. One of them was of this class, and cost me £300; she has great speed and stoutness. She belonged to the almost extinct breed of Seglawi Jedran. She would have made a fortune in India; such a stride—fifteen feet one inch. The Arabs say no one ever got such a horse from them before. I have another now in my stable, which cost me £300. She is of equal breed (Maneghi Stedrudj), equal height, beauty and lasting power, but, unfortunately, she has no great speed, otherwise I would propose to send her to you."

From the above we must only gather that the oriental horse is inferior in every way to the English thoroughbred at anything they may be put to, and notwithstanding the fact that there are a few outstanding Arab animals of much excellence that may be pointed to in the annals of horse matters in England as gauged by their powers of endurance and their beauty, there can not one instance be found where there is any authentic record of any improvement being made on the English thoroughbred by the use of oriental sires. With reference to the endurance of the Arab, so-called, there seems to be no question, and that his power of staying long distances without food and water, and going the while at a smart jog are good; but when it comes to a matter of speed, they have none, which may account for their endurance to a certain extent. Comparing their speed with that of the English thoroughbred, an instance which is a matter of record in the racing calendar in England came under my own personal knowledge. Sir Frederick Johnstone, who is a blood relation of mine, matched a horse called Post Haste against an Arab that had been presented by some eastern magnate to the Prince of Wales, the distance to be four miles on Newmarket Heath. The Arab was said to be a great stayer and very speedy, but Post Haste beat him by a quarter of a mile, and could have beaten him by twice as much if he had been ridden out, and yet the same records will show that Post Haste was a little above a selling plater and not a very successful one at that.

Now if the Arab, which is a galloping horse, can not in any way improve the thoroughbred, whose business it is to gallop only, what object can there possibly be in introducing him into our trotting pedigrees, a strain of the horse of the desert? Do we want to lessen the size of our trotter? Do we want to take from him his great withers and lessen his speed at the trot? In fact do we want to go back 250 years and begin all over again? No, if galloping blood is wanted, why not take the thoroughbred horse as we have him to-day and not go back so far and do over again what the conservative Englishman did with so much labor?

It is said by some that they grant all this and that it is not with a desire to increase the speed or to give endurance that they want to introduce the Arab strain into our trotting pedigrees, but with a view of getting increased soundness, for, say they, with the introduction

Digitized by Google

of the thoroughbred came unsoundness of every description. Very good. Now do these people believe that a single cross, or say two or three crosses, of desert blood would eliminate the unsoundness which they claim to be hereditary in some of our families of thoroughbreds? If they do, they are badly mistaken, and what is more, if the Arab be taken in his native land many unsound horses will be found to exist there where their work is for the most part slow. We all know it is the pace that kills, and the Arab crossed into our trotting stock, if any pace should by any chance result, by reason of some superior excellence of the trotting mare, would be just as liable to the ills that arise during the vicissitudes of training and fitting as our trotters of to-day. And there is yet one more thing to be remembered and that is, as Abbas Pacha remarked to Herr Von Hugel: "An Arab horse is no longer an Arab horse when he ceases to breath the air of the desert."

In most parts of the East we see that their horses are not of much excellence, and from all the authorities we can find we can not discover one that has a word to say in favor of the progeny resulting between the blood horse and the Arab as compared with its English ancestor. It is even so and there is nothing left to do but to consider that as an improving agent the Arab horse has no place on the face of the earth.

LIKE PRODUCES LIKE.

THIS is a favorite phrase with those who have an itching to discourse on breeding, and when further qualified by the addition "or the likeness of some ancestor," it is held that the whole story is told. A few addendos in the shape of illustrations, a jangle of words, words, words, and the volume is closed. Those who have a virulent antipathy to the introduction of near strains of thoroughbred blood in fast trotters, unaccountable in one respect, inasmuch as there is an evident loss of temper at the very outset, depending upon denunciations in place of argument, and prone to hurl—or rather hurtle—this phrase through their clenched teeth, and lean back in supreme satisfaction over the fancied discomfiture of all who entertain contrary views. Like produces like is iterated and reiterated, and when that is admitted to be true, in a majority of cases, they look at the battle as being so clearly won that in accordance with old-time customs they are ready to bind their adversaries to the wheels of their chariots and make a grand parade in honor of victory. But before submitting to being exhibited as a trophy of the superior astuteness of those who think differently on the question of breeding fast trotters, let me present my side, and if it is not sustained by the oftentimes quoted excerpt then turn down your thumbs.

All horses can trot. At least not one has come under my observation which could not progress in what we call trotting action. Not very many can trot fast; very few have the capacity to trot very fast.

If like produces like in a literal and exact sense, then the progeny must be counterparts of their parents, neither better nor worse, like as two peas in a pod, two grapes in a bunch. In that case the only possible way to obtain a 2:10 trotter would be to couple Sunol, Maud S. or Nancy Hanks with Nelson or Allerton, and the only method of getting 2:30 trotters to breed from sires and dams of that class. Just like striking coins in a die, the metal is subjected to the operation and size, weight and stamp are identical.

But, say the sticklers, it is not quite an axiom that like produces like. There is a chance for heredity, atavism, marking back to some ancestor, ever so remote, to thwart our plans. There may be improvement; there may be inferiority; there may be a distinct divergence from the type of the immediate progenitors, reversion to a forbear of whose peculiarities we are ignorant. That is granted and therefore there has to be another qualification that there is likelihood for reversion and that there is at the best the hope that the near kin will have a greater influence than those which are further away. Fortunately practical re-

Digitized by Google

sults establish that portion of the theory and the resemblance to near relatives more frequently met than to those which are distant.

The inheritance under consideration may be classified as physical, mental and nervous. Physical, consisting of form, color and action; mental, the disposition and adaptability to benefit by teachings; nervous, that intangible something, so hard to describe, and yet of such vast potency as to be, in a measure, paramount. The first in this classification is the most readily noted. It is cognizable to the trained eye in all its peculiarities, the expert having the ability to trace the most minute shades and detect likenesses hidden from the ordinary observer; in a measure a gift, a natural bent which can be heightened by use and experience, the foundation inborn. Thus some men can carry one horse so accurately in their remembrance as to be enabled to choose a mate with nearly as much accuracy, after months have elapsed, as if both animals were in view, and select, with marvelous precision, the get of a stallion after seeing a few of his progeny. There are guides to form a prognosis of the disposition, and though far less tangible than physical marks; and again, there are some who have a wonderful knack, a sort of intuitive gift, to tell at a glance, almost, the nature of the animal they seek to fathom. Nerve force is the most difficult of all to forecaste. There may be illusory tokens—indications which mislead—and the favorite colt, which we fondly hoped would be the acme of courage, prove a veritable cur.

Then of these three qualities, all of them essential in the makeup of a race trotter, form is the only part of the inheritance that can be measured without trial, and that only after full maturity has been reached. The others are partially, if not entirely dependent on tests before an authoritative opinion can be formed, and consequently, no matter how richly the parents are endowed, high hopes, though fully justified from the lessons of the past, may end in disappointment. But no matter how often disappointments prevail, it will not do to become disheartened, and in place of surrendering look for the causes of failure. It may be that in accepting the qualities which are shown by tests that which is evident has been overlooked, and form sacrificed, or, rather, overshadowed, in parents which had speed; and it may also be a lack of courage, or a want of endurance, docility, tractableness, or some of the traits which are considered of minor importance.

I will readily grant that if parents could be selected which had all the requisites in perfection, then the motto "that like produces like" would be a safe guide. Even then, what is perfection now may be several degrees below the scale when a future gauge is applied, and therefore there must be a strife to amend, to produce a still better animal than the pattern before us. And now I will outline the plan by which, in my opinion, a fair chance for improvement in fast trotting horses can be secured. It would be a waste of space to offer arguments to prove the dominant tribe of fast trotters, as that is so clearly the breed of that which Rysdyk's Hambletonian founded, that contention, adverse, would be nonsensical. For extreme speed, great speed, moderate speed, or any rate of trotting speed it is so far in advance that there is small chance for comparison. Granting that favorable opportunities have been beyond all others, there it is, nothing to explain, no necessity for apologies or excuses. Inasmuch as the male line from a horse preponderates so largely over the female, it is more than likely, that as generations are added, the celebrities on that side will increase in a corresponding ratio. But after due allowance is made for numerical superiority it is somewhat surprising that when extreme speed is the test that every prize falls to the side of the sons of Hambletonian. There are six trotters with records of 2:10 or better; four of them by sons, not one from a daughter. Five of the six are in direct descent by the male side, and the other has a strain also from the male line. With this before one the selection should be the best male descendant of Rysdyk's Hambletonian obtainable for a stallion. For mares to couple with him the choice would be favored by various circumstances. Laying aside the thoughts of

Digitized by Google

securing broodmares already noted as the dams of high-class animals, as those are only within the reach of wealthy breeders, there is still a wide range for selection, though it will be sufficient for the purpose of this article to give the reasons why I consider that thoroughbred and half thoroughbred mares are desirable and in accordance with the maxim quoted even when fast trotters are the aim. Perfection of form is just as surely an attribute of the blood horse as the capacity to run fast, and that form peculiarly applicable to correct the Hambletonian where it is faulty. Tractability, intelligence and docility in an eminent degree, endurance beyond all other breeds when the criterion is the highest speed over such distances as races are run and trotted, high courage and hardiness of constitution. That the form of the thoroughbred is the best adapted for a great flight of continued speed at any gait will be acknowledged by a large majority of those who are in a position to judge. That a certificate will be awarded them as progressing intelligence and docility will surely result when application is made to those who have been in "daily touch" with them for some time, and when that acquaintance covers their employment in all of the domestic uses to which horses are usually put, and that there will be flattering testimonials in all other respects bearing on their fitness for the service of mankind is beyond question. They can not trot fast is the rejoinder, and "you propose to rear a mixed breed," comes from one objector. "Half-and-half," says another, and both cry, "like produces like, and you will produce a mongrel, neither runner nor trotter."

I answer, my object is to combine the good qualities of both parents, reproduce the adaptability of the sire to acquire the fast trotting action, secure the desirable traits of the dam, and in this way endeavor to obtain an improved type of the fast trotter. This may be termed an experiment. All kinds of breeding are experimental, and whether this method is more risky than that which adheres to what are termed trotting-bred lines will be argued hereafter. But while theorizing it is legitimate contention to offer analagous cases, or nearly similar cases, to support the position.

A celebrated breeder of greyhounds, finding that his dogs were becoming deficient in courage and that each succeeding generation displayed a greater lack of that essential element, introduced a cross of the bulldog. That was a distinct departure from the type of animal desired, all other qualities at variance with the object, but after the undesirable traits were eliminated, by subsequent adherance to the true form, it was found that the fault had been overcome. Now, in the case of the thoroughbred mare coupled with the fast trotting stallion, the only antagonistical quality is that she is not a fast trotter, and that none of her kin are fast trotters. It may be a latent quality, notwithstanding that it has not been shown; but inasmuch as a large proportion of trotting-bred mares can not trot fast after having been trained, it must be accepted that it is very unlikely that the gift is hidden. Some of the trotting-bred mare's relatives, near and remote, must have trotted fast, and in that respect she has the advantage in that alone. There are trotting-bred mares with so many distant strains of thoroughbred blood, or one very near line of that blood, that form and other characteristics approximate very closely to the thoroughbred, and these should receive a very high place on the trotting stud farm, and I shall not cavil at those who would give them the first place, if conjoined with trotting speed, advise every breeder that can do so to secure the prize.

Now if a cross of the bulldog could be advantageously used in breeding greyhounds when there was only one quality, or at the most two, to benefit, viz., courage and strength of constitution, when there is absolutely not a single trait which should be eliminated, the success of the dog experiment is an encouragement.

Other illustrations from the histories of breeding improved animals could be given, though it will be sufficient for my present purpose to offer only one, that being the origin and perfection of the thoroughbred. The original blood was Barb, Turkish, Spanish and English, and after racing was fairly established a fur-

Digitized by Google

ther mixture of these named and Arabian. Although alike in one way, viz., capacity to race, that was held in different degrees, while there was quite a divergence in the form. The Barb was the fastest, the largest, and the "loosest;" the Spanish had the most endurance and more compact in form; the Turkish intermediate between these two; the English contingent those which had gained distinction on the race course before the Oriental were imported. The early importations of importance were made in the seventeenth century and the first half of the eighteenth, and in that seventeenth century flourished by far the best horsemen of the period, one of the best writers on the horse of any period. That was William Cavendishe, Duke of Newcastle, and in his work, "A New Method to Dress Horses," published in 1667, he gives descriptions of the various breeds of horses with which he was acquainted. They may be summarized thus:

"Of the Spanish Horse.—If he be well chosen I assure you he is the noblest horse in the world. First, there is no horse so curiously shaped all over from head to croup. He is the most beautifnl that can be, for he is not so thin and lady-like as the Barb, nor so gross as the Neapolitan, but between both. He is of great spirit, and of great courage, and docile; hath the proudest walk, the proudest trot and the best action in his trot, the loftiest gallop, the swiftest careers, and is the lovingest and gentlest horse, and fittest for a king in a day of triumph to show himself to his people, or in the head of an army of any horse in the world.

"Of the Barb.—He is as fine a horse as can be, but somewhat slender and a little lady-like, and is so lazy and negligent in his walk, as he will stumble in a bowling-green; he trots like a cow and gallops low, and no action in any of these actions. But commonly he is sinewy and nervous, and hath a clean strength and is excellently minded, and good at length, to endure great travel, and very apt to learn. * * * The Mountain Barbs, they say, are the best. I believe they are the largest, but for my part I rather desire a middling horse. * * *

"Of the Turkish Horse.—I have seen very few of them; but two merchants brought three Turkish horses to Antwerp, very fine horses, but oddly shaped; their heads were very fine, but like a camel's head. They had excellent eyes, and their necks excellently risen; somewhat great bodies, the croup like a mule's, legs not great, but marvelously sinewy; good pasturers and good hoofs, and their backs risen somewhat like a camel's. I had a groom, a heavy English clown, whom I set upon them, and they made no more of him than if he had been as light as a feather.

"Of the English Horse.—The English horse is less wise than the Barb, fearful and skittish for the most part, and dogged and rebellious to the manage, and not commonly so apt to learn. But those they call English horses are so compounded of horses of all countries that they always participate something of their sires, and so that may somewhat alter the case. Certainly English horses are the best horses in the whole world for all uses whatsoever, from the cart to the manage, and some are as beautiful horses as can be seen anywhere. * * * For English mares, there are none like them in the world to breed on, but then you must choose them fit for such horses as you would breed. * * *

"Of the Arabian Horse.—I never saw but one of these horses, which Mr. John Markham, a merchant, brought over and said he was a right Arabian. He was a bay, but a little horse, and no rarity for shape, for I have seen many English horses far finer. Mr. Markham sold him to King James for £500, and being trained up for a course, when he came to run every horse beat him."

These are the most important constituents in the composition of the thoroughbred of the present day, and the point I desire to make is, that as the fastest of the quartet of breeds was the Barb, and the formation of the Barb the best fitted for great speed, the conjunction with the other races, inferior in that respect but superior in others, resulted in an animal better even than the Barb, that the combination of the fast trotting stallion and the thoroughbred mare therefore should

Digitized by Google

give a good chance to secure progeny which would possess trotting speed, and the other necessary requirements essential to success on the track, and value in the breeding stud. If the "slender and lady-like Barb" was transformed into a shape like that of English Eclipse, Stockwell, Newminster, or other great celebrities of the race-course and stud in England and America, by the incorporation of blood which had not as much speed at the gallop, but a more compact form, better weight-carrying powers, greater endurance and hardier constitution, and in effecting this change of form for the better, speed was not lost but the capacity engrafted to "carry" it for longer distances, it is reasonable to anticipate that deterioration will not follow a somewhat analagous system of breeding. Newcastle, from his personal knowledge, *knew* that the set of Barbs and Spanish horses could race, and in that knowledge there was a good foundation for the belief that when the two were united racing speed would not be lost. With the Turkish horse it was a presumption, an inference drawn from the form exhibited, and the blending of that with the strains which could race more in accordance with the hypothesis that good will come from the union under consideration. The next sentence to those already quoted in relation to the Turkish horse reads: "They appeared not so fit for the manage as for to run a course, which, I believe they would have secured. They trotted very well and no ambling at all." In another part of the book he writes: "Some commend the Turk very much for a stallion to breed running horses, but they are so scarce and rare that I can give no judgment of them; and therefore I advise you to the Barb which, I believe, is much the better horse to breed running horses." Those who commended the Turk were in something the same position as the advocates of near crosses of thoroughbred in fast trotters were a few years ago, as in Newcastle's day the tentative stage had not been fairly passed. Among the Turks which figure in English pedigrees, Place's White Turk was the only importation before the date of the publication of the duke's book, and as Place was studmaster to Oliver Cromwell, had his horse been the paragon of all others, the "Governor to our most Glorious King, and Gracious Sovereign, in This Youth when He was Prince of Wales," would not be likely to see any good in him. Nevertheless, the Turks were potent factors in the formation of high-class running horses, and the student of early race-horse breeding will run across their names in every noted pedigree. Their capacity to carry weight was no mean acquisition, and these old-time workers who ran under from 140 to 168 pounds are "more than likely" to have inherited that from such ancestors as could carry a "heavy English clown and make no more of him than if he had been as light as a feather."

I will add another illustration, and for that go to the vegetable kingdom, and as "Iconoclast" in a late and able paper draws attention to the lessons in biology which are presented from "self-fertilizing plants," with that endorsement it can not be called out of place. Phylloxera threatened the destruction of the vine. Invading countries where the vine was cultivated to any extent, and progressing with such rapid strides, there appeared to be no escape, and some of these fanatical bigots who are opposed to nearly all the beneficent gifts of the great Creator, or at least those which do not comport with their gloomy ascertions, bloated over the prospective destruction on the plea that it was a direct providential interference with the manufacture of wine and brandy. But others, guided by a better principle, and no more ready to give up the "wine of refreshment" than the "corn of nourishment," sought for a remedy and found it, not in a direct attack on the poisonous parasite. A counter poison with which the ground was charged had little effect. Aqueous submergement was effectual, but this could only be used on level ground. Seemingly a hopeless task when the happy idea was struck that by uniting another quality that which would not be affected by the pest was the remedy. In the Mississippi valley grew a vine so hardy that it was proof against phylloxera, but the fruit was comparatively worthless. You will have a "mixed-breed" was the cry,

Digitized by Google

worthless for wine-making, and after the tests had thoroughly established the position that the resistant root and the grafted scion produced grapes which could not be told from the product of vines that the phylloxera killed, then it was claimed that the same quality of wine could not be manufactured. After that was shown to be incorrect, then Arthur E. Shipley, M. A., fellow of Christ's College, Cambridge, England, in the last edition of *Encyclopedia Britannica* published: "Again, certain varieties of American wines, which have the reputation of being phylloxera proof, have been grafted on European stocks; but this has been of doubtful success as regards the phylloxera, whilst the wine made from such vines has undoubtedly deteriorated." That is not correct according to my understanding, and A. E. S. M. A. F. C. C. C. E. is in error. Not having references I can not state authoritatively, but am under the impression that the native resistant root is used to graft the vine upon which bears the kind of grape wanted, and the fruit is identical with that of the parent vine, and just as good for wine-making. Like some of the writers who have been determined in their opposition to thoroughbred and half-bred mares, Mr. Shipley was too intent on substantiating his views to give credit for what had been actually done in a contrary direction. The comparison may seem far-fetched, and yet there is analogy in likening the ovum of the thoroughbred dam to the resistant stock of the vine, and the fertilization of the egg by the spermatozoon of the trotting stallion, and that the chances will be good for a combination of both parents in the offspring, and thus obtain higher form, more quality, greater endurance from the dam, fast trotting action from the sire.

JOSEPH CAIRN SIMPSON.

Oakland, California, August 17, 1892.

PROBLEMS IN FARRIERY.

The Philosophy of the Trotting Stride.

THE fundamental principles which underlie the balancing of the trotting horse are those relating to his physiological structure and motor provisions, when considered in relation to his extremities. Until the farrier knows, exactly, the muscles used in his walking and those employed in his trotting and their modes of operation; until he marks his footprints, and studies his stride upon a prepared surface, like the planed race course, to ascertain the direction and variable pressure of the feet, and the peculiarities of his articulation and motion, he can not possibly understand how to dress the feet to accomplish specific purposes, either for giving mechanical assistance to correct motion, or for remedying defective action. Indeed the farrier should be a practical horseman, not only a thoughtful roadite, but an observant driver to harness, where he can intently watch every movement. Thus from both the resources of extensive experience, and the suggestions of an ingeniously mechanical mind he can devise methods for properly shoeing the swift trotting horse. The dual question. What is the order of foot progression, when the horse walks, and trots? would not receive an accurate answer from many horsemen, for very few of them have critically studied the question. The accurate response that each footstep, in a walk, is in a separate and distinct cadence, the forefoot first, the hind foot on the opposite side next, followed by the other front foot, and then the other hind foot last, in regular succession, may be regarded as sufficiently precise for the purposes of this paper. There is never any variation of this order; but the first step of the front foot is never a full stride, only sufficient to enable the opposite hind foot to make a full stride. The nearest approach to it is when the walk is quickened into either the slow or fast trot. Then the diagonal front and hind feet rise and descend practically at the same instant; so that the only appreciable difference between the walk and the trot is the more rapid descent of the hind foot, on the opposite side of its companion front foot. From this analysis it is easy to understand why so many horses pass from the clear distinct walk to the trot and why some of them keep up the motion into the rapid diagonal action, for

Digitized by Google

the slow and fast trot are not only more in consonance with the walk, but the amble or pace is a radical change from both the walk, trot or the galop, which, nevertheless requires much less skill both to attain speed and to preserve the center of gravity than does the trotting action. The definition of the trot is more generally regarded as having little influence upon the more rapid gaits, and has, therefore not been carefully studied. But this conclusion is a serious error. When the horse trots the off hind and the near front feet rise and descend together, and the near hind and off fore feet come down together, or so nearly simultaneously as to escape the discrimination of the sense of hearing. But these answers are merely preliminary to the investigation of the peculiarities of the more rapid extensions. They in no wise suggest the more subtle variations as to the direction and comparative length of the front and hind strides, and the presence or absence of harmonious correspondence between them. Horses are multiform in shape, and consequently multiform in the variety of their trotting action. In many instances the body is short and the limbs long, while in other cases the limbs are short and the body of great length. In many types the muscles of the stifle and forearms are compact, while the cannon bones are long and quite as often they are of the reverse formation. The exactly balanced horse, having the proper length of body, with such a correspondence of the propelling to the sustaining muscles, and such a length of the extremities below the hocks and knees, which are dead weight so far as the question of aids to the muscles of locomotion are concerned, is very rarely found, even among creditable trotting performers. Scientific breeding thus comprehends very much more than approved lineage. The greatest performers have not only their heads full of trotting ambition, well under control, in great strains upon their nervous organizations; not only the bodies balanced as to length and breadth, and as to the dimensions and quality of the muscles of locomotion; not only the limbs of the exact proportion with reference to the dimensions and capacity of the carcass, but the entire organism is such a perfect equipoise in the adaptation of its mechanism to great trotting momentum, with the length of stride always well within its capacity for sustained speed and the rhythm of the action so perfect that the well attuned ear of the trained horseman can not detect the slightest discrepancy in the footfalls, nor his eye the slightest difference in the length of stride of the front and hind feet. The reader may exclaim this perfected brain and body and extremities are yet to be concentrated in one single living mechanism. Possibly that perfection has not yet been attained, but we are approximating to it by scientific mating and the combination of the most prepotent blood lines. Let any studious observer who has been familiar with paddlers and single-footing trotters and straddlers and awkward performers that extend their front feet out so far before them that when they land they seem to be engaged in the desperate effort to pull the solid earth of the course behind them, and dwellers and hobblers and sprawlers, all abroad on all four feet, pitching and tumbling and breaking at frequent intervals, in the double attempt to regain their center of gravity, and to compass the mile in something less than three minutes. Compare them with the trim, true, rapid, precise, frictionless action of Axtell or Nancy Hanks, or any of the greatest performers with records better than 2:20, who trot with their limbs at the greatest advantage well up under the body in almost straight lines, moving with a confidence and resolution and steadiness and speed that betoken the perfect trotting horse, both mentally and physically, and he will begin to realize the superior benefit of trotting form as a factor in the perfect trotting organism. The brain could not accomplish this supreme result without a nicely adjusted physical balance, and the mechanical equipoise very often requires the farrier's art to properly level and arm the feet in order to properly balance the action. The study of motion in differently constructed horses is intensely interesting. When the surface of the course has been planed and the horses to harness are walked and driven up and down on the smooth surface for critical

Digitized by Google

inspection, the footprints are susceptible to measurements that demonstrate either physical perfection or incongruities in locomotion as plainly as do the quotients of an equation elucidate a proposition in geometry. The citation of a few instances will form interesting object lessons.

Quite a speedy son of the great George Wilkes was first brought out for an exhibition. He is a desperate plunger. He rushes to his frequent breaks always with a desperate brush of speed. When he recovers, it is only after several equally desperate headlong attempts to regain his trot. Then comes the perfect cadence, followed with increasing speed, and the rapid, irregular stroke, attended with the broken rhythm before the terrific breaks and demoralized plunges, in which the hind quarters are violently elevated as if destructive kicking to the displacement of the driver was imminent.

The reinsman was requested, at first, to walk him. The footprints plainly showed that the hind feet did not extend as far forward as the front ones by about six inches. Then he was slowly jogged and the footprints, to the surprise of the spectators, changed. The hind feet extended as far front as the forward feet, but just outside of the impressions of the fore feet. The jog-trotting was as square and beautiful as the most fastidious horseman would desire, with the single exception that there was too much spread of the stifles and elevation of the hind action. When he was urged up to his speed, then the hind feet extended fourteen inches beyond his front feet and, then only, his trouble began in earnest. Palpably his propulsion was in excess of his carrying capacity. This did not result from the preponderance of his power in the hind quarters, embracing the coupling, hips, stifles and gaskins, over the muscles of the forearm; for he is proportionally as strong in front as he is behind. But the fore limbs being too short and thus out of balance with the unduly extended leverage of the hind quarters, are over-trotted by the hind feet just fourteen inches at every stride. They thus work at a disadvantage, *too far under the body*, which makes it extremely difficult for them to sustain the carcass when the momentum becomes extreme. They are literally cramped, in position, when the enormous hind leverage thus overstrides them, and bends them far up under the carcass to their palpable disadvantage. They soon become exhausted, and, to relieve their overtaxed position, the horse indulges in these headlong breaks to regain his lost center of gravity. This diversity of stride, resulting in forcing the front feet too far under the body, is more frequently the cause of leg-weariness than deficiency of carrying capacity forward. Unless the hind stride is lessened, or the front stride is lengthened, he will never become a steady, well-balanced, reliable trotting performer. The average horseman would attribute this turbulence to the violent willfulness of his disposition, but these terrible lunges are not only exhaustive but destructive to his machinery. His physical condition being excellent, he would not indulge in them to his own discomfort and injury, unless his lost center of gravity and danger of falling headlong upon his face rendered this desperate remedy of plunging and running a physical necessity. Instead of condemning the brain and temperament or the sharp molars of this unruly performer, if the disparity between the strides of the front and hind pairs of limbs had been noted by the measurement of the footfalls, it would have been plain that the difficulty was physiological, not mental. The remedy is purely mechanical, not the application of intemperate brute force, or the infliction of still more excessive training.

The next performer had an exceedingly annoying mixture of gaits in his movement. The rhythm gave the exact cadence of single footing, when at full speed. When he walked, the hind feet landed ten inches behind the front ones. When he jogged, the discrepancy was considerably lessened. But when he speeded, the front feet extended so far beyond the body that they had the appearance of being about to part company with the remainder of the mechanism. The hind action seemed to shorten as the speed increased till the rhythm of the footfalls became so confused that single footing and trotting became inextricably

Digitized by Google

confounded. His motion, too, became exceedingly labored; but the painful exertion was confined exclusively, to the hind quarters and limbs. They were utterly unable to keep up with the front strides. Hence the body was racked with the discordant action, and the tired hind parts, overtaxed by this unequal disposition of locomotive capacity, invariably gave up the struggle by changing from single footing to galloping. The forearms were notably long and full, while the stifles and thighs were exceedingly short and thin. Unless the front action is reduced and the hind movement extended by the lowering of the head and neck and by mechanical appliances to his feet, the only controlling agents of the extremities, he will continue his unsatisfactory action, despite of all the bits and harness, and skill of his trainer, till he is permanently retired from the course.

The third performer was the beautifully gaited veteran Schuyball, record 2:26¼, but whom the writer recently timed a mile in 2:19 in his seventeenth year. When he came out for the inspection of his action every spectator remarked that his gait was perfect, and that description answered exactly, so far as the length of his stride is concerned. *He walks and jogs and trots precisely in the same footprints.* His action, therefore, is perfectly balanced. There is no overreaching, no undue widening, no interference. He moves without protecting boots, without rolling, or weaving, or twisting his body. The carcass seems to be at rest. The movement seems to be confined exclusively to his limbs and feet. He therefore rarely leaves the trot, even when forced by voice and whip up to tiptoe speed. So far as the *length* of his stride is concerned, and the perfect placement of all his feet at every footfall is considered, his action is perfect. He is a line trotter, and therefore loses no muscular force in undue width. The only lost motion is in the excessive height of his action. If he moved close to the ground, as the Electioneers do, to their base of action, his speed would have been increased with the expenditure of the same muscular power several seconds. From this observation it is apparent that even when the hind and front feet on the same side land in the same place the action may not be perfect. The stride may be of the proper length to correspond with the length of the carcass and with the relative extension of the propelling muscles of the fore and hind parts, but if there is any lost motion, just in so far is there present a constant hindrance to the greatest speed. When the trotting action is a balanced stride, making but two impressions, and there is no lost motion, then the speed becomes phenomenal, and steadiness is merely a question of condition. Axtell and Nancy Hanks and Arion and Sunol and Maud S. are of this perfect type. Their action answers to all the requirements of this critical analysis. But there are very few whose trotting movement is thus absolutely precise. Contrary to the general impression, when the stride is quickened as the speed is increased, its length is not shortened, but both quickened and lengthened. In the purview of these observations and measurements how crude seems to be the conclusion that there is nothing in trotting form, but the whole question revolves around the vague misnomer of "trotting instinct." There are many peculiarities in the trotting stride. Some horses overlap the front footprints with their hind feet when walking, and bring them into the same footprints when jogging or speeding. Others walk in the same steps, but overlap with the hind feet when both jogging and speeding. Still others will walk in the same steps, overlap when jogging, and bring the hind and front prints together when moving rapidly. When the stride is alike in extent of the two pairs of feet, the placement may not be exactly similar. For instance, in the walk some great trotting performers will plant the front and hind feet in a line, or will place the hind feet either outside of or between the front feet, and widen the hind action considerably in a jog, placing the hind footprints from two to six inches wider than the front ones, which spreading is narrowed all the way from one to four inches as the gait is increased to its greatest capacity.

Then, again, the stride not only changes in extension, but in time as the action is accelerated. Some horses will

Google

stride sixteen feet on a three-minute jog. This will be increased to seventeen feet when the speed is increased to two minutes and forty seconds, and to eighteen feet when trotting a quarter in thirty-five seconds, so that, by actual measurement, the stride is *both extended and quickened*, instead of quickened and shortened, according to the general belief, when the speed is accelerated. Now all these careful measurements and observations of trotting footprints have furnished the data for not only determining the efficacy of certain special patterns of shoes, which will be considered in a separate paper, but of explaining certain incongruities of action that have heretofore been regarded as impossible. It has been deemed as impossible for the hind feet to overlap at every stride the front ones. Such a difference might preserve the rhythm of the trotting motion, but the hind parts would part company and forge ahead of the front parts. An intelligent critic from Denver writes to the *Clarke's Horse Review* that if the hind stride was a foot longer than the front one and yet both made in the same interval of time, the hind quarters would reach the wire, while the fore quarters were at the distance stand. Nothing seems to be more obvious than this conclusion, for a gain of one foot at every stride would place the hind quarters, if disconnected with the fore quarters, at least that far in advance. But the conditions present are union, not disconnection, and a living mechanism, not an inanimate machine. The measurements herein noted and the rhythm of the footfalls are rarely in unison. An exceedingly able correspondent, scientifically educated in mechanics, thus describes a trotting stride: "It is made up of two supports and two flights." This is very succinctly stated. The time of both supports is alike, and the time of both flights correspond. But the time of the supports is not the same as that of the flights. With different trotting movements their relative times materially change. The dwelling-gaited horse, for instance, unduly prolongs the supports. Just in proportion as the speed increases the time of the supports is lessened, and the length of the flights is increased. The time of the supports and the time of the flights of the two pairs of feet must necessarily correspond. But the length of the stride of the hind feet, with reference to that of the front feet, not only changes in the same horse at different rates of trotting speed, but decidedly in different horses. Take the stride of the horse whose hind feet overlap the front ones just twelve inches. Now measure the next stride, and the overlapping is not increased to twenty-four inches, but remains at precisely twelve inches; and each succeeding stride shows the same relative positions of the front and hind feet. Now one of two conclusions is inevitable. Either the front stride is the same in length as the hind stride after the first revolution, which would be an anomaly, or the deficiency between the strides is overcome by the compensation afforded by the momentum of the body. The flight or movement of the carcass at every stride most certainly must make amends for this want of harmony in the strides of the front and hind pairs of feet. In no other way can this disparagement, as shown by actual measurement, be satisfactorily explained. This is one of the wise provisions of animated mechanism, rendering its operation both more flexible and accommodating than inanimate machinery, whose movements have no compensations, but are the results of inflexible laws that make the relationship of corelated parts absolutely rigid. Again, the depth of the footprints, or the degree of friction, as shown by them, are valuable in determining the relative propulsion exerted by the front and hind limbs. When the action is balanced and the hind feet land at the side of the front footprints, then the depths, when accurately measured, of both are exactly the same. Then both pairs work at the greatest advantage. The hind levers force the body just far and fast enough for the front limbs and feet to support the carcass with the greatest ease. When the hind feet overlap them, then their footprints are deeper and they not only do all the propulsion, but that propulsion is so greatly in excess of the supporting capacity of the front limbs which work at the disadvantage of being bent under the body or crippled in position. When the hind feet do not ex-

Digitized by Google

tend as far forward as the front feet, then the front footprints are deeper, showing both by their depth and the downward pressure of the toes that the front feet act as propellers as well as supporters, which adds materially to the laboriousness of the action.

Now, to demonstrate the force of these conclusions, take a matured horse from the pasture whose gait is balanced, barefooted, by the evidence of only two sets of footprints. The hind feet land precisely in the front footprints. Now experiment with the head and neck. Mark the natural carriage of the horse when his action is balanced. Then elevate the head. To make the result striking, elevate them very high, and move him up to his speed. The hind feet will not fall into the front footprints, but drop behind them. The time of the footfalls has not been disturbed, but the relative length of the hind ones with reference to the forward stride has been changed, as demonstrated both by observation and measurement. Now, with a standing martingale, draw down the head and neck. By moving the horse at precisely the same rate of speed as before, the hind stride will overlap the front one, frequently attended by the discordant sounds of clicking and forging.

These variations in the relative lengths of the front and hind strides are accounted for by shifting the center of gravity; in the first instance, backward, by elevating the head and neck, thus unduly taxing the hind quarters to the shortening of their stride; and in the latter, by overloading the front limbs and feet, thus shortening their stride, while that of the hind limbs were lengthened by this relief from shifting the center of gravity forward.

Now intensify the results by arming the feet with shoes. Restore the head and neck to their natural position. Then arm the hind feet with heavy shoes, and let the front feet remain unshod. Drive the horse up to the same rate of speed heretofore attained, and the hind feet will overlap the front ones—not because the front feet are sore, for the trial may be made upon a soft, deeply harrowed course. The hind action is not only extended but elevated, and yet the time of the front and hind strides, or, in other words, the rhythm of the footfalls, remains unchanged. Clicking and forging may result; tumbling and hitching will sooner or later follow, but the fact remains that the hind stride overreached the front one, as clearly demonstrated by measurements, and yet the hind part does not reach the wire first. Now reverse the treatment. Place heavy shoes on the front feet; at once the action changes. The front stride is lengthened, while the hind stride conforms to its normal length. Were it not for this capacity of the momentum to supply the deficiencies of faulty action, there could possibly be no remedial farriery; but, if, in certain instances, the hind stride can be made to remain unchanged, while the front one is lengthened, so as to correct a palpable faulty action, and balance the movement, then the balance of correct trotting action can be attained. If, in the diagonal gait, the one stride is longer than the other, the diagonal feet move backward and forward together, so that it is palpable that the deficiency of one in length must be supplied by the momentum of the body. The sufficient substantiation of this position is found in the fact that, at the finish of a mile the difference in the length of strides is no greater and no less than at the first revolution.

The investigation of this subject demands a profound mechanical insight into the movements of the horse, without which the whole practice of shoeing for any ulterior purpose than that of protecting the hoof from undue wear is entirely without a practical application.

For illustration: Direct trotted a mile in 2:18 with heavy shoes and toe weights on his front feet. He paced in 2:06 when the heavy front shoes and toe weights were changed to merely light plates. The effect of the heavy shoes and toe weights were to elevate, quicken the elevation, and extend the front feet. They did not modify the length or the elevation of the hind stride. But they changed the front action so that it could keep out of the way of the hind movement. If the hind stride had been extended by this treatment, at the same time, obviously the front feet could not keep out of their

Digitized by Google

way, and the use of the heavy shoes and toe weights would have been entirely without any mechanical efficacy. When they were replaced by light shoes then the front action became lower and shorter, and the relief from interference came only with a change of action from trotting to pacing. No more forcible example of the effect of weight in changing the front stride while the hind stride remains undisturbed could be adduced.

When the heavy weights and shoes were taken from his front feet, why did he not continue on the trot? Observation discloses the fact that with much less weight his front action was neither so high nor so extended, while the hind action remained unchanged. This was the defect in the trotting action of Direct. He had too much hind leverage for his front stride, and balance came only with the change in his front action, wrought by weights on his front feet. But when they were removed, and he was taught to change his gait to pacing, then there could possibly be no forging or interference, because the front and hind feet on the same side move backward and forward in unison, and the difference in their respective length could not be a disturbing factor.

If the stride of the feet on which toe weights are placed are not lengthened independently of the stride of the other feet, what other possible result can the extra weight beyond the increased elevation of the weighted feet; for the rhythm or time of the footfalls is not in the least disturbed. The diagonal pairs of feet come down together at precisely the same time, whether the extra weights are imposed or not. To prove that the stride of the weighted foot is lengthened as well as elevated, it is only necessary to measure its length, both with and without the weight, and the result will sustain the assertions contained in this paper. Possibly a more complete refutation of this theory of simultaneous elongation of both the front and hind strides, when one is changed, by mechanical means, is found in the ingenious device for balancing the action of the noted trotting gelding, Edwin Forrest. The difficulty with his action was that the off fore foot had less elevation and stride than the near front foot, and neither one was sufficiently extended. His ingenious trainer, Mr. Miller, now placed a four-ounce toe weight on the near front foot, and a six-ounce weight on the off front foot. After he had repeatedly experimented by changing the ratio of weights, he finally equalized the action by this curious combination of weights. There was nothing at fault with the rear stride, nor was it changed with the variations made in the front stride. If, for instance, the four-ounce weight extended the near fore foot two inches, and the off hind foot, in trotting was extended a corresponding distance, while the off front foot was extended by the six-ounce weight three inches and the near hind foot was carried just that distance further forward, it is evident that the lengths of the hind strides would have been seriously disturbed and hitching would have been the inevitable result. But the fact is that the rhythm of the trotting action was not disturbed in the least, showing that the hind strides were not affected, but that the faulty front strides were brought into harmony with them, and the entire action was thus ingeniously balanced.

The condition of perfect balance is the preservation of the relative weights of the front and hind hoofs. Very frequently the horse is balanced, barefooted in the field. This equipoise is maintained not only by the carriage of the head and neck at an angle in consonance with general conformation, and muscular capacity, but by having undisturbed the relative weights of his front and hind hoofs. The writer has excess to an almost unlimited number of green feet, in the resources of the large fertilizer establishment that receives the carcasses of all the horses that meet death in a large city and its environs. When these feet are properly dressed, with reference to the normal length of the toes and height of the heels, and then sawed off evenly around the coronet, and weighed with all their contents unmolested, it will be found that the average weight of the front hoof is three ounces greater than that of the hind hoof. Now the purpose of this disquisition has been to demonstrate what a potent factor extra weight becomes in changing the action of the foot to which it is applied. Unconsciously this change

Google

is affected when the relative weights of the front and hind feet are disturbed by leaving an overgrown foot either in front or behind. If one is dressed to specific dimensions, all should be pared to a corresponding size. Moreover, if the front feet are armed with six-ounce shoes, the equipoise of a perfectly balanced horse demands that the hind shoes should invariably weigh three ounces less. The practice of placing, for instance, ten ounces on the front feet, when the action is balanced, and then a variable weight on the hind feet, ranging from two to eight ounces, instead of a seven-ounce shoe, as indicated by the relative weights of the front and hind feet, in the green state, is both injurious to the action, and physiologically unscientific. But this subject will receive extended consideration when the different patterns of shoes are described and discussed. S. T. H.

AN ANSWER.

BY L. E. CLEMENT.

EDITOR OF THE MONTHLY:

I clip the pith of a reply to my article in June number of the MONTHLY from a late copy of *Western Resources*, the whole pith is in the table, which, if all the circumstances were equal, would be *prima facia* evidence of the correctness of the position taken by *Resources*:

History and experience have demonstrated that mares of inferior breeding are much more liable to produce speed when coupled with stoutly bred and impressive sires, than are their full brothers when coupled with the most intensely trotting bred broodmares in the land. This will, we believe, be accepted by all, and Blue Bull 75, in many respects the greatest horse in history, is further evidence of this fact; his daughters produced forty-one trotters and pacers, and his sons sired forty trotters and pacers. There can be no question but what if Blue Bull had had more sons well bred on the maternal side he would be a much stronger fountain of speed than he is to-day, but history and facts remain, and while we admire the ability of the old horse to carve fame for himself out of such material that would have resulted in utter failure with many another and more fashionably bred horse, we still must consider him as a sire of sires of speed to be inferior to some others.

In proof of this assertion and for the purpose of replying to Mr. Clement we take the following horses that are represented in the second generation that have a greater number in the list than Blue Bull 75, who has eighty-one. In this brief and hurriedly compiled table we give the year in which each horse represented was foaled:

NAME.	Year Foaled.	Sons.		Daughters.		Sons.	Dam.	Total.		Gain Total.
		1892.	1887.	1892.	1887.			1892.	1887.	
Blue Bull	1854	26	5	36	10	21	26	81	16	65
Abdallah 15	1852	13	12	26	19	1	7	160	108	52
Almont	1864	64	27	36	9	37	27	242	57	185
Belmont	1864	57	13	26	9	24	17	218	43	165
George Wilkes	1856	74	29	34	4	51	30	528	57	471
Hambletonian	1849	129	103	59	39	28	20	1,077	537	540
Mambrino Chief	1844	28	23	17	15		2	110	94	16
Mambrino Patchen	1862	37	20	52	18	14	34	145	53	92
Volunteer	1854	29	18	29	16	11	13	120	53	67
Woodford Mambrino	1868	16	8	17	6	8	11	102	35	67

How are the circumstances equal? and is the question one of the breeding on powers of the sons of the respective sires? I have made some rather exhaustive examinations into the causes. Alexander's Abdallah foaled when his sire was only a three-year-old, and living only thirteen years, and that in a time of war when everything was unsettled, and dying ten years before any

Digitized by Google

of his get had entered the 2:30 list, and yet having a larger number in the 2:30 list, credited to him and his descendants, than has any other son of Hambletonian.

On account of these things many will always consider him the greatest son of "The Old Hero of Chester." In order to see how the sires named in this table are *now* breeding on, I have gone back to 1887 and have taken the sons and daughters of each that have since that time taken their place among the producers. I find that Blue Bull makes a gain of twenty-one sons and twenty-six daughters, and a total gain from sons and daughters of sixty-five, that Alexander's Abdallah gains one son and seven daughters, and from all his sons and daughters adds fifty-two.

It is not unfair to compare Blue Bull with the great son of Hambletonian foaled the same year, as well as with the two greatest sons of Mambrino Chief for the four years last passed. Volunteer has ten sons that have newly entered the list as sires and the ten have fourteen in the list, the age of one is not known, the average age of the other nine is even sixteen years.

There are but two so young as Kentucky Volunteer, *whose dam* is by Blue Bull, and while he has three in the list with an average of ten and two-thirds winning heats, Volney has but one performer with three heats, St. Leon has but one performer with one heat. The total gain of Volunteer in the four years from the produce of his sons and daughters is sixty-seven, only two more than the gain of Blue Bull from the same source.

Woodford Mambrino makes a gain of nine sons whose average age when their first standard performers entered the list was fourteen and seven-ninths years and a total gain from all sons and daughters of sixty-seven, two more than has Blue Bull from the same source.

Mambrino Patchen makes a gain of sixteen sons whose average age when their first standard performer entered the list was fifteen and fifteen-sixteenths years, and the whole sixteen sons have put twenty-two in the list, a total gain from all sons and daughters for the four years of ninety-two performers.

Of the 2:30 performers put in the list by the sons of Mambrino Patchen they have won an average of eleven and four-elevenths heats in 2:24$\frac{13}{32}$—Woodford Mambrino represented by ten sons with an average for each performer of four and one-half heats and 2:27$\frac{17}{16}$.

Volunteer is represented by ten sons whose average number of heats is four and one-half and whose average time 2:25$\frac{3}{16}$, while the poor old pacer "That in the nature of things can not breed on," is represented by twenty-one sons who have five and eight-ninths heats in an average time of 2:23$\frac{3}{8}$ and some of them are two and three years old. I have never claimed that Blue Bull with his ninety *non standard* sons was showing as large a number of 2:30 performers as Hambletonian with his 600 sons and their representatives, heading every breeding establishment in the United States, with very rare exceptions, nor the sons and grandsons of George Wilkes, backed by the millionaires of the United States, and every man and every turf paper crying, as I heard it in Indiana, the same sentiment that *Resources* gives vent to, in not quite as choice language as *Resource's* uses: "Blue Bull was the greatest sire that ever lived, but second Blue Bulls are'nt worth a damn." But I do claim that in spite of all opposition Blue Bull's sons and daughters are breeding on in better shape than most of their more fashionable contemporaries and that they are advancing in money value faster than any other family, and that, almost without exception, where a horse has been coupled with the daughters of Blue Bull the produce, except in rare cases, is the fastest of his get. No one had any confidence in Phallas 2:13$\frac{1}{4}$ until he was coupled with Mila C. and produced Merlin, the fastest of his get to the present time, and without Blue Bull dams Roger Hanson would have no representation in the list.

The fastest trotter and the fastest pacer by Legal Tender (Amos) both in the 2:20 list are out of daughters of Blue Bull.

Western Resources seems to be trying to confine his statements to Blue Bull as a successful sire of speed, siring sons and I only incidentally mentioned the success of his daughters in order to impress on the minds of the readers of the

Digitized by Google

MONTHLY the fact *that there is no* weak place in the blood of Blue Bull. An addition in the last four years of nearly one-quarter of all his entire sons to the ranks of producers while Hambletonian has been forty-two years in getting one-fifth of his sons to that exalted position, allowing there were seventy of them gelded, is something the friends of Blue Bull must be proud of, when we consider that of the twenty-one, thirteen of them were non-standard at foaling time. We can get a glimpse of what the future has in store for such sons as Rushville, sire of Gipsey Queen, 2:19¾, and twenty-seven heats in 2:30 or better. Accident, 2:32, that started five times, won first, once; second, twice; third and fourth, once each. Judge Thurston, 2:56¼, two years, and started four times, once with aged horses, the only time he was unplaced, and winning every two-year-old race he started in. Miss Lettie, 2:54¼, (three years) that started five times and won four first moneys, and one second. Gold Leaf, 3:01 (two years) started four times, and got three second moneys and one third; winning second money at Albion, Neb., in three-year-old race. So many winners from old Rushville have been sprung since Gipsey Queen astonished the Kentuckians by leaving the prairies to scoop the 2:22 class at the Kentucky breeders meeting at Lexington, and yet her sire is standing at St. Edwards, Neb., at $35 the season. Where can you get such chances of racehorse speed, for so little money. At Ft. Wayne, Atlantic Chief, by Atlantic, son of Almont, dam by Blue Bull, in 2:40 pace, entered the 2:30 list, placing three heats between 2:26 and 2:20½, and Razor Back, by Harry B., son of Blue Bull, entered the list with a record of 2:27¾, pacing, while Headlight is credited with Betty Golden, 2:21, at the same gait. I see by the last issue of *Resources*, they have heard from Mineola, N. Y., where the get of the black horse "Grove's Blue Bull" won first money in the two and three-year-old trots, and third money in the yearling dash. In the same city that *Resources* is published they had a race meeting, and on June 18, 1891, the chestnut gelding, Little Wonder, took a record of 2:27¼ and the summaries give him as by Wonder, and as Wonder is by Blue Bull, he is given as untraced, but will, like Gipsey Queen, appear right in the 1892 Year Book, but it won't do to have them come in too fast.

I have not yet found a list of new 2:30 performers for 1892, that gives the old dead "Hero of Flat Rock" credit for Rosa B., yet she went in some days since. When I saw that a three-year-old, by Kentucky Volunteer had trotted in 2:21. I could not help thinking, and wondering, if the pacing dam of Kentucky Volunteer had anything to do with the extreme and early speed of his daughter.

I have stated that one-quarter of all the entire sons of Blue Bull, as we get the number from the most authentic sources, have entered the list as sires of speed within the last four years, and already one-third are represented as sires of standard speed. enough has been shown already to show that Grove's Blue Bull will enter that list.

Billy Davis already has two pacers in the 2:30 list, and one of them the little engine Pat O'Brien, can speed better than a 2:20 gait at any time, and will surely take a record better than 2:25 before the 1st of September.

Palisade, son of Blue Bull, bred by I. A. Hodson, of Mechanicsburg, Ind., is the sire of Sam Ball (pacing) 2:29¼. Harry B., owned by John Manlon, near Rushville, Ind., has just put Razor Back into the 2:30 list, with a record of 2:27¾; these already give us more than one-third of all his entire sons that have sired 2:30 speed. On the same farm in Missouri stands a non-standard son of Blue Bull and Nutword, and it is dimes to buttons that if the colts are handled at the same age the Blue Bull will be standard first, *by performance* of his get. *Western Resources* has given us a table that shows Abdallah 15 the only son of Hambletonian that has two representatives in the table. While Electioneer, with his 103 in the list, one-third of them having only one heat in 2:30, and Onward, the son of George Wilkes, that is more potent than any other son of this mighty branch of the Hambletonian family in his breeding-on powers (so they tell us), has twenty-one tin cups, and eighteen non-repeaters,

Digitized by Google

that is, that have not yet shown racehorse quality to put the second heat in 2:30 or better. Electioneer and Happy Medium and Nutwood within the next four years will displace Mambrino Chief, Woodford Mambrino and Mambrino Patchen. The table of the ten sires, having the most to the credit of sons and daughters *will have but two families represented, Blue Bull and Hambletonian.* Until Volunteer is displaced, the sons of Wilkes will not be in it.

Within four years more, the changes that will be made in the first ten will show Mr. Reed how puerile were his comparisons in 1892, and how futile the attempts to stop so strong a stream with the scratchings of a pencil, or the parrot phrases of wealthy rivals.

Although the table prepared by *Resources* gives Blue Bull the lowest place, he will not stay there, the great value of the blood will be better appreciated, as, with their better advantages, Rushville, St. Nicholas, Blue Bull Jr. and Prompter lengthen their lists of both 2:30 and 2:20 trotters, and all are now represented in the 2:20 list except St. Nicholas, who has had very few starters in the past and yet has a three-year-old with a record of 2:21½; and as the daughters of Blue Bull are added to the list of great matrons, at the present time with thirty-seven representatives the percentage of producers to the whole number in existence is probably greater than the percentage of any other family. Hambletonian, with his 600 daughters has only fifty-nine producers. How fast the relative positions are being changed. Four years ago Hambletonian had thirty-nine and Blue Bull ten, nearly four times as many, and now fifty-nine to thirty-seven, or at that time a difference of twenty-nine, and now a difference of only twenty-two. Years ago the compiler of the trotting register gave utterance to the idea that the daughters of Blue Bull would be as much greater than the daughters of Pilot Jr. as Blue Bull was greater than Pilot Jr. himself, and time will show how prophetic was the statement. Already the shadows of coming events cast their shadows before, and the despised pacer, whose family has been placed after the Clays, the Black Hawks and the Mambrino Chiefs, if placed at all, without the help of wealth or favorable environments, will step into second place, the great prototype of the greatest of all the factors in the formation of the breed of American trotters.

I think the readers of the MONTHLY will excuse me, if I in compact form formulate the standing of the family as I now found it by the records.

1. Blue Bull has sired one more trotter with twenty winning heats to his or her credit than any horse that has ever lived.

2. Blue Bull's get as a whole have won more contested races than the get of any one horse, George Wilkes *alone* excepted.

3. A larger percentage of his colts are represented as sires and producers, to the number sired, than can be claimed for any other sire, yet have they come in, in a shorter time, and fewer in numbers to each son and daughter.

4. That there are not more in the second generation than are credited to any other sire is due wholly to the same cause, for there being more wool sheared from white than is sheared from black sheep.

5. For the first time in the history of the family, the well-bred sons of Blue Bull are being selected by breeders who have interest in developing speed and Prompter, Rushville, Jim Wilson, St. Nicholas, St. Omer, and some of the better class of his sons will have opportunities equal to their sire, and though inferior to those of inferior quality, in fashionable families, they will yet be enough to write the family name among the first ten great sires, equaled by few and surpassed by none.

This is the present standing of the family as the records show it. Before closing the comparisons to be derived from such a table as was given us by *Resources,* it is well to look at some of the causes for the apparent greater progress of some of the other families. Take for instance from Woodford Mambrino the get of sons of Primrose, by Alexander's Abdallah, out of the old pacer, Black Rose, and we have but seventy-two left.

Take from Belmont the produce of his son, Nutwood, that is out of the dam

Digitized by Google

of Maud S., and we have reduced it as much as the gain in four years of any of the sons of Hambletonian, except George Wilkes, and Woodford Mambrino and Volunteer gain just what such a subtraction would make for Belmont. Almont depends less upon any one of the great broodmares, but it is without such that we are most forcibly struck with a sire's breeding-on powers.

HAILING THE HACKNEYS.—Continued.

BY R. C. A.

Other Relationships.—The father of the Hackneys, the famous old Shales, was got by a son of Blaze, out of a well-bred hunter. Blaze was sired by Flying Childers, out of Betty Leedes, tracing directly to "D'Arcy's Yellow Turk, out of Barb Mare," on the sire side, and to Leedes' Arabian and Barb Mare on the dam's side. Blaze's dam was Confederate Filly, tracing on either side to Brownlow's Turk and Duke of Rutland's Black Barb. "Though," says Mr. Euren, "there was a large proportion of English blood in Blaze, yet the preponderating element was Barb and Arab, the trotting tendency of which would appear to have mixed freely with, and to have added to that inherent in the strong, common-bred dam of the Original Shales."

In the trotters, Hackneys and Orloffs, the Barb seems to have made a lasting impression. Euren refers to "the Barb, to which variety our modern English Hackney horse owes so much." Forrester made a similar statement in regard to the indebtedness of the American trotter. The same is true of the Orloff, also (if additional force were needed to be given to the arguments evident from such facts) of the famous Spanish Jennet. All these are proofs of the influence of "determinative blood."

Characteristics.—Sources of Gait and Action.—Of the characteristics of gait possessed relatively by the Arab and Barb, when one comes to examine the subject he seems to have little difficulty in allocating to either a preponderating tendency. The Arab, an inhabitant of a level, open country, possessed a gait made by easy stretching out—the gallop or run. The Barb, reared in a hilly, rocky or uneven country, had, necessarily, a different gait; he had to step shorter, higher and more carefully, thus begot his peculiar trot. Blunt remarks: "No pure Arab is a high stepper," while he is also less fast at the walk than the Barb.

Those acquainted with the later contributions to the history of the horse are familiar with the position therein of "the great horse." This was the horse "mete for the wars," a weight carrier. He was also called the heavy, double-trotting horse, the Almaine whose gait was a "verie hard trot." As the system of war changed this war-horse also changed, cavalry and men being less heavily armed. "Activity rather than ponderosity was henceforth the characteristic of a mounted soldier. Euren quotes an "Order for Mustering Dymylances and Light Horsemen, Their Armour, &c.," issued by Elizabeth's government in 1584. It is interesting to quote: "Every dymy-lance to bee either uppon one sufficient stoned trotting hors or else a longe trotting gelding, with a strong lether harness. * * * It is thought allowable that the guelding trotte or rack. A lance must have a trotting horse or a lardge trotting gelding, with a strong leather harnyss * * * the gelding to trotte or rack." In a "certificate of due obedience" to this order the horse mentioned is described as "one trotting or racking gelding." "The horses fit for such service," Blundeville said, "should have a trotting pase." He also mentions the light horsemen of England "riding in the warres" either on ambling colts or on trotting colts, though the latter were kept partly for their servants to ride on, and to carry their "males and cloke bagges after them." These were stout and able to stay, riding forty, fifty, or threescore miles a day.

Dr. Grey, author of "The Jockies Masterpiece," is also quoted by Euren. The following, by that authority, considering the age in which it was written, is worthy of all praise: "If you design him [the horse] for the war, then the

Digitized by Google

lofty trot is most to be esteemed, and to know that he is cleaner therein; take these observations—in the taking up his legs and cross-moving his limbs, as when the far hinder leg and the near foreleg move and go forward, and in the same manner the two other legs in good order and equal distance, and in this motion the nearer the horse takes his limbs from the ground, the opener, the evener, and the shorter [straighter?] he treadeth, the better will be his pace, and the contrary declares much imperfection." We have quoted the above in full, though what we here specially wished to direct attention to was particularly the phrase "the lofty trot." Dr. Grey mentions the other gaits: the amble (our pace) "is the best for pleasure," "the rack (which little differs from the amble, only is more active and nimble) is the best for hunting," and the gallop "is requisite for racing." Of the latter he remarks: "If he gallop round and raise his forelegs he is then said to gallop strongly, but not capable of much speed, and is fitter for the war than racing."

Dealing here so with the gaits the following by the Duke of Newcastle, appears in that authority's great work: "The walk is the true motion of a slow trot. [Next he describes the perfect amble (pace)]. In a gallop he may lead with which foreleg you please, but then the hinder leg of the same side must follow it when he gallops straight forward." He goes on to assert that "a trot is the foundation of a gallop. The reason is a trot being cross of a gallop, both legs of a side, and when you trot him fast, beyond the power of a trot, it forces him, when his inward foreleg is up, to set down his outward hinder leg so suddenly as to make his inward hinder leg to follow his inward foreleg, which is a true gallop; and thus a trot is the foundation of a gallop. An ambling being a shuffling action, I would have banished the *manage.*" The *manage* was the fashionable school of riding where the arts and styles approved by the elite were practiced and patronized. Horses for *manage* were riding horses. The *manage* may be regarded as the successor of the tilt yard. The duke further remarks: "There is no horse that hath forelegs can go, but it must be the action either of an amble or trot; for galloping and running is another thing, and so are all ayres (airs) in the *manage.*"

To conclude this interpolation as to gaits of the particular class of horse we are investigating, we note that Mr. Euren quotes as advertised horses, each of which in 1700 and 1709 respectively, "Paces altogether" and "Trots altogether," altogether meaning uninterruptedly, without deviation or admixture.

Other Sources Suggested.—When one watches the action of the knees of the best class of draught horses he will be astonished at the remarkable flection displayed by these joints. The foot is lifted so that the shoe looks up at the girth. There is, too, mostly in the heavier British horses a certain amount of forward dash of the fore limbs. The writer was impressed with these facts while thinking over what has just been written. Hence might have been derived from the knee action of the "high trot" and "hard trot" of the great double trotting horse—the lineal ancestor of the Shire, one of the chief "parts" of the Hackney. In the past, from whence it secured this action, its "bent" was directed into masterly flexion at the expense of speed. Whereas in the trotter it was speed that was developed at the happy expense of the unprogressive flexion.

Sidney thus describes the type of Norfolk trotter, just before the initiation of stud-book interest in the Hackney. "The type of Norfolk trotter is not over 15.2, made like a refined edition of a Suffolk punch or Clydesdale cart horse, with extravagent action; with a rate of speed varying from fourteen to seventeen miles per hour for short distances [which would be called long for an American trial]. Their weight renders long distances at a great pace on hard roads an impossibility." Thus is admitted some connection with heavy, hard, trotting races. Bishop Hall in his satires shows us that, in Elizabeth's time.

* * * Some merchant * * hires a Friezland trotter, half yard deepe,
To drag his tumbrel through the staring Cheape.†

This indicates that trotters were occa-

†Cheapside.

Digitized by Google

sionally derived from that unlikely part of the continent. One celebrated mare, that trotted in 1800, namely Phenomenon, was "half Freizland or Flanders." Of the same general stock no doubt are the Hanoverians. These "bend their knees up to the curb chain, and flourish their feet while making the least possible progress in a slow funeral procession to, or rapid return from, the cemetery." This distant source may also be taken into consideration in tracing the possible derivation of the Hackney action, though we are not inclined to rob the native breed itself of characteristics which, from the nature of the country, were likely of spontaneous origin.

Foreign Demand Helped the Development of Hackney Action.—There is no doubt of its being the foreign demand, that preferred high stepping, that really directed the attention of the Britisher to the greater possibilities in the heir of many a line of high-knee actors, as found in the Hackney. "A hack, nowadays, that can carry weight, and do nothing else but walk well, stepping briskly out of the ground, carrying his own head, is worth money, provided he has good character and manners." All these the Hackney has. Then the trotting, too, must now be executed with the most mechanical precision. Many horses may have extravagant knee action, "but not be safe to ride." Safety is secured "not in the manner of lifting the feet, but in the manner of setting them down." Riding soon develops any fault in this direction. Training to harness, is therefore preferable, by which the full free action is developed in the opinion of Sidney. The question whether the horse can make better speed does not enter into this consideration. The English standpoint differs considerably from the American, for we find one of our most renowned trainers recommending the return to the saddle for trotting—as it is "easier" for the horse to make speed under that, than in front of the sulky.

These peculiar requirements of leg action have been developed in a way that exhibit, very characteristically, the different goals in view by English and American breeders. The Hackney "pick up their forelegs prettily enough, *but leave their hind legs behind them.*" "The great fault now is that people look too much to foreleg action, and forget the more important hind-leg action." The comparison with the trotter that is here evident need hardly be pointed out, except for literary completeness. It is simply that the "stay-in-place" exhibition of the Hackney is ruled by the stay-behind-action of the posteriors, just as the "get-out-of-sight" exhibition of the (American) trotters is forced by the get-away powers of the same. The "pop up in front" and the lazy lagging behind are characteristics, however, that advanced breeders are correcting.

Passage Through Several Phases.—"Trotting was not one of the amusements of the English gentleman." His hereditary knowledge of trotting—in the wars, at the joists, in the manage—was of a "hard" kind. The result was the development of the slow, steppy, airy trot—not for speed, but for the satisfaction of the senses. Hence the wiles of war, the arts of the tilt-yard, the airs of the *manage*, and now the cadence of the park or row, are natural steps and successive results or evolutions of the other, exhibiting transference of powers of action to various forms.

The hackney "is a small horse, and fifty years ago his representative was much smaller." To-day he is the product of an art that has rapidly developed him from his ancestors, many of whom were not bigger than ponies. In the stud book we find such excellent specimens of pony as Sir Gibbie, by Denmark, dam by Triffit's Fireaway. This is a representative case, for Denmark and Fireaway were the sires of many 15:3 champions.

It will have been noticed the gradual alteration in the character of the heavy armor carrying horse to the lighter clad horse of the light-mounted cavalry, an absorption of a particular class of *managed* horse, which in its varieties included all the lesser sized elements (as compared with the great "trotting" horse), and which came to be included, as we have seen, in the Hackney.

As to Speed.—To-day practically the British trotter is extinct. He is "dead," as he used to be regarded. But for that

Digitized by Google

same purpose—of a roadster, ridden to saddle—it ought to be also said that in America such a trotter hardly ever existed. The American trotter was born, not to become a saddle trotter as his cousin was in England, but to become an animal of sport in his highest development, and occasionally a harness driving pleasure horse. But it was only on the track that his speed was developed. For this purpose he never existed in Britain. Certainly of late in Britain trotting on a course or track has been originated, we can not say revived. But practically this sport is entirely engaged in or controlled by American horses, not the "old English trotter."

The American idea of trotting to-day *is* to get to the end of a mile in the shortest possible space of time. The English idea of trotting *was* to do the greatest number of miles for the longest endurable time. The American ideal *is* one mile in 2:00; the English *was* 100 miles in ten hours, or twenty miles in one hour. The greatest speed recorded in the Hackney Stud Book seems to be that of the dam of Fireaway (Goulding's) 207, who was sired by Smart's Hercules, by the great Jenkinson's Fireaway 201. This mare trotted two miles in five minutes. This was for the period (Fireaway 207, was foaled in 1818) quite phenomenal.

What He is To-day.—The Hackney has become mostly a specialized harness horse—the more he is of this the less of saddle character he has. Thus from saddle speed to harness handsomeness has been the development or evolution he has gone through. In this he presents another contrast to the American trotter, whose speed has been developed to its greatest in harness. Both are products of the wants, tastes, fancies and fashions of men. Both are perfect in their spheres.

As to what a Hackney "should be," it might be said shortly that their conformation should be faultlessly symmetrical, and their action perfectly mechanical. A model Hackney is easier distinguished by the senses than described by words. But when we come to describe each point of any perfected breed, and say that such and such point "should be" thus and thus, the reality seems non-existent. It seems to us that "what is, is," and there description ought to begin and end. But in describing an ideal to be attained or reached this criticism does not apply.

We do not intend to give a word picture of the Hackney as it might appear in all its beauty. This is our resolve, not for the purpose of shirking any part of our task, but for the purpose of using the space that would be so occupied with some comments on the descriptions already formulated. We take, for this purpose, that, the best we know, written by Alexander Morton of Darvel ("The Hackney Horse:" Dunlop & Drennan, Kilmarnock, Scotland). We shall quote, with or without comment such striking points as seem to be special to the Hackney.

"The back * * with strong, well developed muscles along each side, forming a hollow along the center," this *hollow* indicates the character of the origin of the breed—from the class of horses known as cobs, ponies, hobbies, etc., in which the muscle seems to be more developed than the bone.

The "gentle droop on the quarters" is desirable, giving a very graceful outline besides more leverage to the muscles.

Then the head is borne high and "tied in as with a bearing rein," and the tail is carried straight out. These two points "go together." Perhaps the crest is derived, distantly, from the Barb, which has a bigger crest and is generally more of the prancing order than the Arab. As to the tail, to show that the Hackney must be freed from any suspicion of artful aid in such respect, we find proof derivable from "his lineal ancestor."

Blunt, writing of the Arab, remarks: "I have seen mares gallop with their tails out straight as colts, and fit, as the Arabs say, to hang a coat on." A family of horses, indeed, is renowned in the desert as being descended from a mare of whom there is the following tradition: Her owner was flying from the enemy, and being hard pressed he cast his cloak, in order to relieve the mare of that unnecessary weight. Having distanced his

Digitized by Google

pursuers, he halted, and his surprise may be imagined when he found his cloak lodged on his mare's outstretched tail. This animal was ever after known as "the mare of the cloak."

Mares have been seen galloping with both head and tail high to an extent that could hardly have been believed had it not been seen. The tail was not only high, but seemed to be right over the back and, besides streaming out behind like a flag, covered the loins and quarters. "It was a splendid sight to one who could appreciate a horse." A single horse with the tail carried so streaming might be mistaken for three riding abreast. This high tail carrying is one of the chief points in judging an Arab.

Blunt says the Nejyd horses are distinguished by the splendid carriage of their heads and tails. Every horse at Hail has its tail set on in the same fashion—in repose, something like the tail of a rocking-horse, but *not* thrown out in a perfect arch. In motion the tail is held high in the air, looking as if it never under any circumstances could be carried low. It has been suggested that this "fashion" is partly, at least, the effect of art; that before the foal is an hour old its tail is bent back over a stick the influence of which treatment is permanent. This is possibly another libel on tails.

There is one family of American horses, the Mambrino Patchens, which "alone among American bred nags is distinguished for the beautiful carriage of tail." The same distant influence may be traced in these. Thus what the Irish term the "jumping bone" is naturally prominent in many strains.

"*Flat bone*" *a Modern Error.*—The bone below the knee is, of course, "short *and flat.*" Now here we have something to say as to this perennial "stock" expression of writers on horse points. They seem to be daft on *flat* bone. We remember once, a few years ago asking a youngster, using a knife handle to illustrate the question: "In what *direction* was this flatness? Was it antero-posterior (front backward), or laterally (from side to side)? According to the ideas of the word obtaining among some horse reporters it should be antero-posterior. But if any one picks up the cannon bone—the remains of a dead horse—he will at once find that the bone is *broadest* where it "should be" narrowest—and he will thus immediately see the error of the modern description. The flatness of the bone is *from side to side.* It is necessarily so, when one appreciates the nature of the articulations, which *expand* above and below. A section of the bone would be concavo-convex, or semilunar (with rounded sides). When one runs his thumb and fingers down the "leg" of a horse, one does get an impression of flatness. But as the bone itself proves. it is not of flatness of bone. Whence, then, is it?

The posterior surface of the bone, it will have been noted, was slightly concave. Situated in and behind this shallow concavity, are the tendons, levers, etc., the tendons that do all the high lifting, and it is the arrangement of these that give the idea of flatness; but it is not of bone, so ordinarily implied.

"This flatness of bone" is therefore a gross modern error. How did it originate? Curiously we possibly have found a clue. In lately studying "the old lights" we find Gervais Markham was, according to the *Edinburgh Review*, July, 1864, as pointed out to us by Mr. Euren, "the first who brought forward prominently the merits of the English horse." He was born 1566. In his defense of the British horse, he remarks of his legs, "and all his lims large, lean, *flat*, and excellently jointed in them, exceeding any horse of any country whatever." The italicized word, we believe, is an interesting "discovery," the whole description is correct; the *flat* is not erroneously used to qualify the bone, but the limb itself. The above is the first occurrence that we are acquainted with of the use of the word *flat* in such connection; and we might believe that from that it has at last been perverted to a special and erroneous application to the bone of the leg itself. As we were writing this, in perusing Upton's remarks on Arabs, we find in a description of Major Gwalkin's Arab horse Barefoot a famous specimen of the breed, the words "leg flat" are used, as it is seen, correctly, to apply to the character of the

Digitized by Google

limb. And Blunt describing the legs of Arabs, says they "are strong, but with *less bone than back sinew.*" Vero Shaw, too, we note uses the correct phrase "flat legs."

"Then, of course, he must move straight, both in walk and trot. The twisting one foot over top of the other is no use in any breed; and the higher the action all round he will always be sure to fetch the more money."

In repose the Hackney is a monument of "buttressed attitudinizing," in motion an evidence of marionette or clockwork action. "And," says Mr. Morton, "it is indeed not an easy task to put into words one's ideal of this animal, for it is a thing easier and more able to be felt than described. It is like a fine picture. You can feel its beauty more than you can describe it. You may have two animals almost the same size, and even with nearly the same shapes, yet the one may be a pure loveable Hack, and the other a commonplace, lifeless brute. Take a new copper farthing and compare it alongside a half-sovereign. One finds them much the same in size, color, and general appearance, yet the one is worth hundreds of the other. It is made of different stuff and has a different ring with it. And so in our pure-bred Hackney there is always some mysterious electric fire that distinguishes it from all other horses of its own size and shape, and gives to it a value no other horse can have; and unless you can feel this subtle beauty and value, it can never be described to you. There is this electric fire about a Hackney of the proper sort that makes him the essence of all horses. From tip of the ear to the last hair in his tail he is the model of symmetry and beauty. Quiet and affectionate in the stable, there is yet in his composition that something which, at the merest word or touch, can electrify him into the liveliest and brightest of animals. It is this quality above all you must try to find in the Hackney, and when you do find it all other horses will then appear dull and common."

Some Hackneys in America.—In Volume I of the Hackney Stud Book occurs the name of Fordham, 237, foaled in 1877, color a black chestnut. He was bred by Thomas Smith, Fordham, Yorkshire. This horse was imported into Canada by the well-known stockman, Hon. M. H. Cochrane of Hillhurst, P. Q., in the year 1881. This was the first modern Hackney to cross the Atlantic westward.

The importation of Fordham secures for Hillhurst the distinctive claim to be reckoned as the oldest Hackney stud on this side of the Atlantic. The mares Gipsey 129, by Primo 636, and Countess, by Cook's Old Times 535, were imported also at the same time.

Fordham is sired by the great Denmark 177, by Sir Charles 768, by Performer 550, by Ramsdale's Phenomenon 573, by Wildfire 864, by Fireaway (Burgess') 208, by Fireaway (West's) 203, by Fireaway (Jenkinson's) 201, by Driver 187, by Shales (The Original) 699. This it will be seen is the royalist of Hackney breeding. In his dam, grandam and great-grandam—Lady, by Sir Charles (Beal's) 768, Lady, by Merrylegs (Lund's) 449, Lady, by Creeper (Templeman's) *app.*, respectively—he inherits equally royal blood.

The success of the sire Demark (Bourdass') has been in England quite phenomenal, it being quite a common occurrence for his progeny to capture all the prizes in offer. His get were conspicuous for their style and action. Fordham is proving himself no less impressive.

The Hillhurst stud comprehends twenty-one animals of the highest class. Hillhurst is, besides a center of trotters and thoroughbreds. Experiments have been conducted in crossing standard-bred mares with Fordham. The results realized were splendid action and speed. The reverse process has also been tried—mating Hackney mares with standard bred stallions—the results are even better. By such matings it has been proved that the two breeds "nick" most satisfactorily. So that rare class of gentlemen's drivers and riders, combining beauty with stylish action and speed sustainable over long distances, with a load behind, as well as "cattle" fit to carry one quickly out of the mud and over timber without fear of floundering or bungling—this class of horses, so scarce, comparatively, in this country in their future production, has been secured.

Digitized by Google

Mr. A. H. Godfrey, assistant secretary of the American Hackney Horse Society, visited Canada a short time ago for the purpose of preparing some notes on the Dominion Hackneys, which will no doubt prove interesting.

A Hackney stallion called Fireaway (this is the most popular and frequent name in the Hackney Stud Book) was sent out by the Hudson Bay Company over fifty years ago to Winnipeg, and he was a most useful sire.

Some years later a Hackney stallion called Goldfinder (another frequent name) was imported, and after being used in the eastern townships of Canada, and in Ohio, where he made fast time, he was stolen and taken to the South. Mr. Wilson, or Dr. McLean of Meaford, Ont., it is believed knew this horse. It would be interesting to have some particulars about him.

The opinion of "the laird of Hillhurst," handling so many varieties of horses, on any subject connected with the business, must always be worth having. Writing under recent date, he says of the Hackney: "I look upon him as the 'coming horse' of America for general utility, both in town and country, being at once the 'general purpose' animal required by the farmer, the ideal long distance roadster, whether on level or hilly roads; as well as the high stepping, showy parade or park horse, always commanding admiration in saddle, dog-cart or victoria."

Another famous Hackney imported to this country was Fashion (Grout's) 199, foaled in 1878, black-brown in color, 15.15 hands. This horse was purchased by Prescott Lawrence of Newport, R. I., from John Grout of Woodbridge, Suffolk, and brought to this country in September, 1884. Among his get, bred by Mr. Lawrence, are the black stallion Groton, winner of second prize to Fashion at Boston, October, 1891, and first at New York, same year; the chestnut filly Primrose, two years old, winner of first in the harness class, and first in the class for two-year-olds at the first show at New York in May, of the United States Horse and Cattle Show; also first at the late Philadelphia Horse Show. The get of Fashion at the May Show at New York won six first and one second premiums. Fashion himself took the champion prize. At Philadelphia his get won two firsts and one second.

Fashion, besides his great American record, won twenty-one prizes in England. His sire is Confidence (D'Oyly's) 158; by Prickwillow (Tice's) 614—one of the most impressive sires of the breed. The pedigree of Confidence is claimed to comprise the best (Hackney) trotting actors of the present day. Prickwillow's get were acknowledged to be the "finest goers" in existence, and himself the best of them all.

H. K. Bloodgood of New Marlboro, Mass., owns Star of Mepal, already mentioned. He was foaled in 1886; bred by Mr. W. Flanders of Bridge Farm, Mepal, Cambridgeshire, who owned Old Reality 665, winner of the championship at London five successive times. His sire, Star of the North, a splendidly bred Hackney, was first prize winner as a two-year-old at London, 1886. His dam, Sunbeam, is also a champion mare, full sister to Reality, and regarded by Mr. Flanders as the best mare he ever owned. Star of Mepal, was reserve for the Elsenham Challenge Cup, 1890, at London. This was the first and only time he was shown in England, and he then and there defeated Connaught, the succeeding champion and holder of the gold medal of Great Britain. He stands 15.2 and is a lovely goer; his color is a rich brown.

Little Wonder is owned by A. J. Cassett. This bay Hackney was foaled in 1879, and now stands fourteen hands. He was bred by Frank Beldam, England, and imported in 1882. His sire was Flanders' Reality 665, just noted. Little Wonder has taken a large number of first and other prizes.

Mr. Cassatt has a large stud of Hackneys. He intends having a sale in the near future, and then we may be able to give some particulars which may be considered of value to the reader.

Perhaps the most widely known Hackney establishment in America is that of John A. Logan Jr., at Oriole Place, near Youngstown, Ohio. Bonfire is Mr. Logan's choice. He is a great horse. As a mover he set the standard at New York, where he created quite a furore in the ring —though being in hasty condition was

Digitized by Google

not quite himself as to show form and so did not receive the highest recognition many believed was really then his due.

The first importation of Hackneys made by Mr. Logan was in 1888, when Young Derby was brought over. Lord Rufus came over in 1891, Warrior in 1892. Bonfire was purchased in 1892 of J. B. Perkins, of Cleveland, Ohio, in the opinion of not a few as great a horse as any of the breed. The number of mares is large and increasing.

"From the present outlook," writes Mr. Logan, "the future of the breed is very promising. The Hackney is evidently destined to become the carriage horse of America. The market demand is good, the prices ranging quite high."

Perhaps the most representative and widest known stud of Hackneys in the West is that of Galbraith Bros., of Janesville, Wis., who have always been in the van of importers of British breeds of horses. Their first importation took place in 1887, but it is only quite recently that they have gone extensively into the business. The breeding of their Hackneys is particularly rich, and, selected by their partner resident in Britain, has such additional advantage as may be derived therefrom. Writing recently, these gentlemen say: "We think there is a great future for the Hackney in this country, their nice, stylish free action, with their great durability for a heavy day's riding or driving will make them great favorites with Americans." They report the demand as beyond their expectation. In the future as the "interest" and business get thoroughly established, we may find further opportunity of going more into detail as to the "Homes of Hackneys" in America. Meantime "we rest here."

THE HORSE FOR PROFIT.

BY RAY MARSHALL.

II.

Our article last month opening this subject indicated the style of horse that could be grown to best advantage by the man not well adapted to the breeding of the best type of the equine. Every one who has observed the people who drive about the streets or along the country roads is aware that scarcely one person in ten understands or is by nature adapted to the horse. These indifferent drivers seem to lack the general characteristics which would lead them to be on their guard against accidents and on the alert to meet the emergencies that are liable to occur in the busy streets. Scarcely one person in five holds a tight line. Of those who have learned to draw a tight rein, more than half of them neglect to watch their horse and the road in front of them and at the same time to be observant of approaching vehicles from the rear; and thus to be, as it were, vigilant sentinel over their own teams and vehicles.

Aside from this matter of caution in regard to one's safety and that of those with him, as well as the preserving of the horse and other property, there is still occasion for much greater concern in the matter of driving the horse as regards its speed and the amount of load which should be required of it. Some drivers are very careful regarding external things connected with the team, but are seriously lacking in the judgment which is needed to enable them to observe the condition of the road or street and to choose the best of two or three courses which are open before them in the way, all of these being apparently in bad order. The sleepy, drowsy teamster too often allows the horse to drive himself and take his own course, from which practice it becomes necessary for the animal to think and plan to a considerable extent for the so-called man behind it. This is one of the prominent reasons why a high order of intelligence, so to speak, is desirable in the horse of our times. It may be true in the old country that the drivers of drays, express wagons, omnibuses, and the various vehicles of the city streets, and country roads, are particularly thoughtful and observant of the horse or team they drive. It is claimed by some that a man to be a

Digitized by Google

good driver should not be too broad minded—that is, that his mind should not be occupied at any time with reading, or study of any subject that is liable to engage his thoughts when his attention should be given to his team. It is generally agreed, however, that in this great country of ours where every man has possibility of the highest distinction that any man with even but ordinary employment is permitted to be as broad-minded as he chooses. Under this state of affairs it is advisable when it can be done to select the horse for one's work that has the highest possible strength of judgment and observation. To the owner of a horse who is his own driver it is certainly much comfort as he goes about the streets driving or on horseback, to know that he has an animal taking him along with the care which the delicate instinct and observation of its high born nature provides. Life seems too short and the hours of each day appear too few to many business men to exercise scarcely a minute of thought about their driving on the road when they are loaded down with the busy cares of life. It is, of course, not the safest policy, and not advisable either, for one to leave himself largely to the care of even so sensible an animal as the horse, yet it is true in many cases that the noble animal will do better for those it is drawing about than it could be directed to do by its driver.

This statement applies of course, only to the horse of the right sort. Every lover of the equine race who has taken pains to observe the beautiful traits of this animal, and who has read freely of the kindness and apparent thoughtfulness of the animal for its master and particularly its tender care for the children and women who are so much entrusted, as it were, to the care of such a horse, can but remember very gratefully the many evidences of nobility which the facts in such a multitude of cases establish. But recently we took a drive with an old gentleman whose silvery hair of nearly four score years' growth would indicate that he had lost most of his interest in life. But his cheery manner was far from showing any such a condition. He was driving his beautitul old trotting horse, which on casual observation one would regard as probably fifteen years of age. Imagine the surprise created when it was suggested that the age was thirty-one years. It had been the old gentleman's property and the comfort of his family during all of this time. "I wouldn't take $1,000 for the old fellow now," was the remark of the old gentleman. He continued: "It has been worth more than this amount to me in the past in satisfaction, as I have trusted to his 'good horse sense' and as I have entrusted to him my wife and chil- from day to day." This animal would weigh in average condition about 1,100 pounds. He was scant sixteen hands high, and had the blocky build which so many expert judges of horses admire. His bones were medium in quantity, but superb in quality. The hoofs were also of the highest quality. In almost every respect his conformation was of the ideal sort; yet, while to look upon, this creature was truly "a thing of beauty," the principal value in the estimation of the owner was lodged in that quality which he termed the animal's "good horse sense." This was an all-around horse. He was owned on a farm in the outskirts of the city. He was the family driving horse; yet whenever needed, whether it were on the plow, a lumber wagon, the harvesting machine, or the market wagon, it was always easy to fit him into any place. In any of these stations he seemed cheerfully at home.

Here is an animal at thirty-one years of age, which has endured the work of life in this way up to this time. Of the myriads of colts born and grown to the age of three years during this score and a half of years, probably not one in twenty was as useful at the age of twenty years as is this animal right now. On casual inquiry as to why he is so superior to the mass of its fellows the reader would probably be told that this was the result of careful handling and attention on the part of the animal's owner and keepers. It would farther be explained on the ground that the animal was one of very rare physical endurance. Yet while these facts are to be admitted, there is occasion to look farther for the real element of this surpassing endurance. After weighing all of the causes contributing to

Digitized by Google

this remarkable production, development and maturity of an animal it might be said almost phenomenal in excellence, it must be concluded that the great secret of it all is in the animal's disposition and the quality of mind which enabled him to conserve his strenghth and do that which must be done in the easiest way. There is in such a composition the inventive genius, so to speak, which enables even an animal to apply the simple first principles of the art of doing things in just the right way. This same quality is observed among men in their work. This animal is of the type which may be designated as the leading horse for profit, although among the great numbers of them produced on the score of blood lines, and with the effort in advance to secure just this sort, the law of variation in breeding is now so much in force that no breeder can feel assured that he may produce with unvarying regularity the exact counterpart of the parents which he would mate with this end in view. Yet there is to be found among the trotting horses of this country whose blood is clearly free for five or six generations of the taint of the soft bone and sluggish disposition of the coarser animal, the foundation which enables the one who understands the science of breeding to apply himself to the reproduction of the type he expects with a reasonable degree of certainty. The high value which has been recognized in this type of horse during the last quarter of a century, and the extraordinary one which has been given them in the last decade warrants the expectation that within the next quarter of a century at least, that those who give their mind and heart to the matter of breeding may look for a time when their ideal will be produced with almost unvarying regularity.

It is of course to be expected in the future as in the past, that there will be "plungers" in the breeding business who will jump at conclusions and will continue to make serious blunders and find their efforts lacking the crown of success. It is no more reasonable to expect that every breeder will give diligent study to his work than do men in other professions. There is a temptation to speculators to invest and employ their time in an endeavor to make some quick money, which can but be disappointing to many of them from the fact that there will be a lack of judgment in much of the effort made by them to secure instant results. The one who makes profit out of almost any branch of business must begin near the bottom. It is important, too, that he begin early in life. Usually the one who is successful in breeding must have grown up on a stock farm, accustomed to know much of and to have much to do with horses as a boy. There are so many things to be learned and so much that can be learned only by personal observation and contact with the animals that one must begin early to have the time to effect this purpose. During the last five years the names of a few men who were formerly entirely unknown have flashed all over the country and have been kept at the front, in consequence of which many amateurs, some of them past forty years of age, have bought their first trotting horse, perhaps several of them, and are setting out to make a fortune within the next five years. Such quick returns might more readily be expected from prospecting for precious minerals in a promising field than with horses. Any man who can handle the shovel or use a pick may uncover the precious metal, but in the search for high speed not even every fourth man that may be employed, taking into consideration his liking for horses and his apparent peculiar adaptation to working them, will prove to be skillful in finding the going quality and bringing it out even when it is clearly present in the animal. No more can a man without experience, who chances to come into possession of great wealth, set up and successfully operate a banking business among strangers, safely, than can one who is past middle life undertake to use his money and buy animals, quickly turning them into profit by endeavoring to give them the mold of a driver's experienced touches. Such results may occur, but very rarely do such ventures prove successful.

We do not mean to say that the trotting horse should not be developed. It is clear that with modern appliances and with the experience of years which may be drawn upon from the books of successful drivers, by those who could

Digitized by Google

learn to develop speed, that the man who would apply himself earnestly and faithfully to this work as he would to any other business undertaking, can but reap as much benefit from his investments, and probably more, than in many other lines of trade. The development of the trotting qualities in horses certainly gives opportunity to the man of genius for "quick finds." It is, however, not a good idea to invest heavily with the expectation of immediate results even when one has the natural qualities in himself to make a success of horse breeding and training. There is probably no other undertaking in which one should engage with so much deliberation as that of planning to develop the speed in all of the colts which one feels are promising in his breeding business. It is only reasonable to presume that the one colt out of ten which will show the phenomenal speed may be the last of the ten, or perhaps this will apply to the last five out of fifty colts which may be handled. One has, however, the encouragement of some experiences in which the first animal handled, or sometimes among the first animals handled, have proved speedy, and have been the means, as it were, of paving the way of their owners on to farther efforts and sometimes to still more brilliant results. To all appearances the efforts of the California senator have proved very satisfactory, because of his persisting continuously for many years, every year seemingly to crown his labors with great reward as well as placing his breeding and training establishment of late at the very front. Capitalists who are fortunate to secure a leading driver and foreman, and who have the unlimited bank account to lay a broad foundation, and who have the mind and genius to follow out a purpose and to continue right along, if necessary through years, to accomplish that end are not taking serious risks of losing their object if only they are willing to pay well for the brains and skill which must be employed in all the details of breeding, management of the kindergarten, and the general handling of their stock at every stage. A thoughtful observer of results of late years must admit that in many cases the best success has come where the moving spirit in an enterprise to develop speed in one's colts, was himself the driver and general manager of his his own business. Mr. Williams and Mr. Nelson, among numbers who have been successful, stand out conspicuously for their great success. There is, however a tendency to go to extremes in this matter. In the case of the two gentlemen mentioned, time has not yet been sufficient to demonstrate clearly whether their policy will accomplish more than that of some of the great establishments in which the principal only directs by his brain and watchful eye the work of many others. In cases of limited capital it must, of course be admitted that the principal, if he has the tact and genius for driving, accompained by physical strength, should be his own driver, superintendent, foreman, etc. There are cases where men with abundance of wealth to pay for much of the detailed work of their business insist on doing entirely too much with their own hands that which a few hundred dollars per year would pay for and thus leave themselves less exhausted and more free to give their attention to more important features in their business. Such men too, are forgetful of the fact that their own health is more to be considered than anything else connected with their business. It may be suggested incidentally at this juncture, that among owners of horses generally there is too much lack of good sense in their tender care of their pet animals. It is too true that many such men are far kinder to their horses than they are to themselves. Their attention, also, is too often more absorbed in this direction than in the regard for their families which a right appreciation of their duty to their dear ones would urge upon them. It is surely better that a colt should go undeveloped than that the life of the owner or any member of his family should be shortened from neglect which over-attention to this colt would require. In the matter too, of the education of one's children, providing additional help in the household, books and periodicals for adornment of the home and improvement of the mind of one's family, is far more important than the life of any horse. As to the question of

Digitized by Google

ich is of the most importance, one's mily or the horses, there is strong call, w that the actions of the head of the use should clearly emphasize the mat- r in the light which his words would be er unfailing to declare. There is cer- inly no profit in amassing wealth by ans of one's horses and at the loss of e improvement and refinement of one's lf and his family as regards making emselves citizens of the best type and e development of a pure manhood.

The foregoing hints in reference to speed ve been elaborated somewhat to meet e probable suggestion of many people at speed development is almost one with reeding the trotters. We wish here to rotest strongly against every breeder tempting to speed his animals. Every rmer who grows grain does not attempt make all the profit that is possible to e made from it. In the matter of corn lone when it is considered that starch nd canned provisions, the liquors and umerous other products as well as meal re made from it, it would be decidedly nbusinesslike for every farmer who hanced to have considerable capital to el that he should hold his grain and ring it out to market in the form of he most finished product. It is true of lmost every profession in life that it re- uires peculiar genius and especial skill o accomplish sensational results. It is herefore only meeting the apparent ex- ectations of the natural law of things hat a few should do the work and reap he benefits to be derived from the high- st results to be obtained, in the matter f giving great value to the horse. It an not be too often urged upon the breed- r of small means, that he can not, as a rule, afford to spend much time in the earch for speed unless he has such an irresistible inclination to such work that he resolves on speeding as a speciality and believes that he can clearly see the end of a successful career from the beginning. In too many cases such men are dis- appointed in themselves and the major- ity of them, to say the least, after two or three years' experience in their efforts to secure high speed in their colts, would do well to heed the judgment of some of their best friends if they are cautioned in some such counsel as that they are "wasting their time." The proper field for profit in the trotting horse is in breed- ing and general training. We use the term "general training" in place of what is popularly known as "breaking." There is in the breeding of the best type of the trotting horse sufficient work for anyone who owns a breeding farm to oc- cupy his attention without going farther than to simply aim to turn out every colt as a safe and trusty horse for work.

Some years ago the writer spent a pleasant day at Gen. Withers' place in Kentucky, and was greatly impressed with the very sensible suggestions of this grand old veteran. We have never yet been able to get around them. His theory was, as expressed to us at that time, that, as a rule, nearly every breeder should aim to improve the size of his trotters to the extent of securing from 1,100 to 1,300 pounds' weight in his horses, never lo-ing sight of the quality, which he would have at peril, of getting colts somewhat under size. However, if one is willing to "make haste slowly" in breeding, there need be no serious trouble in securing size along with quality in due season. A farmer who has mares of 1,000 pounds weight, and whose makeup otherwise is entirely satis- factory, need not expect and should not desire so violent a development as 300 pounds increased weight in their imme- diate offspring. If the sire sought in such cases weighs 1,200 or 1,300 pounds the average weight of sire and dam in the offspring ought to prove highly satis- factory. It is, perhaps, this anxiety of many general farmers to make a rapid increase in size by the use of heavy draft sires that has done more to demoralize the horse trade at present than any other one cause. It will be found true even in the case of large trotting horses, some- times termed, and properly, "native coach horses," in the course of a decade that this idea, followed with extreme views in mind of size only, will furnish an over-supply of such stock. It is now often true of people who drive a double team continually, because of a broken country and rough roads, that they much prefer 1,100 pounds' weight, and, at times, less, to any increase over this. The average breeder, however, for a few

Digitized by Google

years yet, at least, will not always secure size in his breeding up to his expectations. He may, therefore, with safety, aim for size as suggested (and he will often enough be disappointed), to provide the average size which he or some buyers may prefer. In all of the effort which every horseman makes, it should be ever before him that quality is much better than quantity. If a man can only breed and handle properly four colts per year and put them on the market in such condition that they will find ready purchasers at four years of age he is far better situated than to have double this number which he would be compelled to give an indifferent preparation and so meet a similar market.

It is well enough to consider in this connection the matter of selling half-trained horses as being more than an imposition upon one's fellow man. Too often does the venturesome buyer endeavor to drive such a horse with the result that his own household is maimed, if not afflicted with worse results, and possibly much suffering and distress may be given to the public in our crowded streets. As suggested in our first article it would be far better to let a part of one's horses be of the sluggish kind in such cases. But the question arises, what shall be done with so many half-bred draft mares as are now to be found among the farmers? It is easy enough to suggest in answer to this that a part of them should be used hereafter only for work. Those which have a preponderance or a good amount, at least, of trotting blood in their composition, can be bred to trotting horses, and after two crosses the progeny should become fairly satisfactory for general purpose work on the farm, and often, too, for drivers in the city, especially for the numerous express wagons and other vehicles of moderate weight. It is objected by many general farmers and especially by those who are interested in draft stallions, that the trotting horse is seldom ever heavy enough for heavy farm work. Many are slow to see the fallacy of this argument. In the case of the general farmer, on the well regulated stock farm that is any distance of consequence from railway stations, he realizes that nine-tenths of his trips to town are with light loads, in which he prefers that his team would go at a brisk trot a part of the way. If he makes a business of hauling his grain to market, he can usually take three tons at three trips with a light team in about the same time that he would take the same quantity in two trips with his heavy team. In the case of the deep plowing and harvesting, in all scarcely sixty days of the year, it is easier, as a rule, to drive three substantial trotting horses of good weight than to drive two of the heaviest draft horses. With three such horses for work on the farm, during ten months in the year, there will be the third horse for a supply in emergencies in case one of the three is sick, and for an errand horse for the use of the family, and in the case of breeding mares it is evident that it is far more convenient to have three instead of two, as one is much more liable to have a team continuously. One may start out among the farmers themselves and ask them the style of horse they prefer to work, and it will be found that a large majority prefer the 1,200-pound road horse to any other. They are willing, if need be, to draw lighter loads, and to plow a shallower furrow, at times during perhaps two months in the year, realizing that they will save enough time in the lighter work and trips to be made during the remaining ten months to more than balance the gain with their heavier team for their heavier work.

From an esthetic point of view the trotting horse certainly does more to render the stock farm attractive to the farmer and his family. Few young people enjoy driving on the road to the village, to church, or to social entertainments, with an ungainly team of draft horses, even if they are very quiet. It is true, it may be suggested incidentally also, that some of these very quiet teams are the ones trusted so far that they are allowed to run away. It may be safely said that nine-tenths of the work of the country demands a horse with less than 1,300 pounds weight. It is true that some of it can be done with slight disadvantage by horses of 1,500 pounds weight. It would seem, however, that in the majority of cases this horse, a

Digitized by Google

trifle too heavy for its work, would have to be sold at a disadvantage, if not at a loss. In view of the preponderance of demand for roadsters from the nature of the work of this continent, everyone must be willing to conclude that the horse of profit is the 1,200 pounds trotter whose physical conformation is a model, and whose disposition naturally, and his artificial training, is of the sort which modern times continually demand.

The days of poor horses and breaking are nearly numbered. With the triumphs of steam and electricity, the future sales of the equine will be limited largely to the farms and small villages with occasional demand from the cities. For the highest type of horse, the one with domestic trait thoroughly cultivated, the horse in which the farmer may delight for his own driving, and the satisfaction of his family, from the time it is two years old for two or three years, is the type that will continue to grow in great demand in our cities for the use of the wealthier classes. Every farmer who is handy in training his colts, may find in such, by breeding them right and keeping their pedigrees, a considerable source of income by selling them singly or in pairs after he has worked them several years, during which time usually they should have paid for themselves by this work. It is to be remembered, however, that such stock will not be bred and developed at random. There must be brains to determine what they shall be before they are born. There must be constant thought and heart in one's work from month to month in feeding, handling, driving and working such horses.

The highest success in such cases will be where the breeder aims to train and sell them himself to the man who expects to use them. He will do it, too, with as much pride in his product as has any manufacturer who has labored for years to establish his brand. A farmer who has half a century's success in this line, assisted probably by his sons, may establish a name and reputation which may be continued in the family for several generations, and in this case such a trade mark is valuable, not only to the founder, but as well to his descendants.

The Bicycle Sulky.

The meeting of the Northwestern Breeders' Association of Chicago capped the climax for speed and startling performances. The fact that Nancy Hanks beat the trotting record one day, and that Pointer the pacing record on the following day, would be sufficient of itself to distinguish this meeting forever, as it is almost beyond question that there will never again be such a coincidence. Two years ago the question of the relative merit of time over oval and kite-shaped tracks came up, and many statisticians affixed the letter "K" to performances on the new-fangled courses in order to discriminate against their value. Now the exciting subject is the advantages of the pneumatic or bicycle sulky over the old rigs, and while opinions differ to some extent, the prevailing idea is that, other things, such as the nature of the soil, being equal, a kite track is, on the average, about two seconds faster than an oval track, and a horse can trot about two seconds faster to a pneumatic than to an old-fashioned sulky. It follows that a trotter, using the improved appliances of roadway and vehicle should do the mile four seconds better than he could do in the comparatively recent days when Maud S. set the mark at 2:08¾. The sticklers for the old order will now, probably, demand that such performance shall be distinguished by a "p," for pneumatic, as well as "k" for kite, and in their minds these backseaters would phonetically interpret the letters as standing for "kwite poor," as I have heard old-timers belittle the Chicago mile of Nancy Hanks in such a way as to make their uneducated auditors believe that the sulky did it all, and that the mare was entitled to no credit. But all this talk will die out. Kite tracks may not supplant oval tracks, because the latter are so superior for spectacular purposes, but the pneumatic sulky is bound to supersede all others in the nature of things. It can be built very light, the rubber-cushioned tires do not cut into the ground and alleviate concussions and vibrations, the ball-bearings reduce friction, and the lessened diameter of the wheel is a great advantage in going around the courses.

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, SEPTEMBER, 1892.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00
All in one order..... 35.00

Meeting of the Board of Censors.

THE Board held a meeting on the 16th inst. at the office of the Association, all members being present.

In the case of the disputed pedigree of Arion 18000.—C. W. Allen, W. L. French, J. W. Knox, LaFayette Robinson, John Harmon, Capt. Walter Cook, Morris J. Jones, Mrs. J. W. Knox and Miss L. French appeared in person and were examined by the board. No evidence having been filed by the owner or former owner of the horse, and it being impossible for their representative to be present, upon request the case was continued for further investigation. [Mr. L. Brodhead declined to act as a censor in this case.]

Ketch, bl. g. 2:18¾.—Evidence was submitted in person by Mr. F. A. Baker, of Detroit, and Mr. A. B. Donnelson, of Pontiac, and the board asked to establish his paternity. By mutual consent the case was continued for further evidence.

Jenny Wren (pacer), 2:17½.—Application was made by John Wren, Springfield, Ohio, for the registration of this mare, with the following description and breeding: Jenny Wren bl m foaled 1885. Bred by John W. Lynn, New Moorefield, Ohio; got by Hailstorm 813; dam Jessie (bred by Joseph Lynn, New Moorefield, Ohio), by Republic 4898; grandam Cricket (bred by Joseph Lynn), by Flying Cloud 134. This breeding was disputed by Lynn, who made a counter claim that Jenny Wren was sired by Colonel Moore 2701; dam Jessie, by Republic 4898; grandam Cricket, by Black Crook. Upon examination of the evidence submitted the board unanimously decided that the pedigree submitted by John Wren is the correct one, and ordered the mare registered accordingly.

Lieutenant 10160.—In Volume VIII the grandam of this horse is given as a daughter of Clifton Pilot 2026. Evidence has been submitted which proves conclusively that the sire of the grandam was not Clifton Pilot 2026, but a non-standard son of Old Pacing Pilot, who made several seasons at Louisville, Ky., under the same name, and the party making the original application was misled by the similarity of name and stated that the sire of the grandam was the standard horse. Ordered that the registration be cancelled and the number withdrawn.

Molly Rogers.—In Volume VIII this mare is registered as sired by Tom Rogers 2124; dam by Kentucky Clay, 194; grandam Brown Kitty, said to be by Mingo. Evidence was submitted to the board which proved that the breeding of the dam as registered was incorrect, and that the true breeding of the mare was as follows: Molly Rogers, b m foaled 1882, by Tom Rogers 2124; dam Black Maria, by Cassius M. Clay Jr., 22; grandam by Stockbridge Chief, son of Vermont Black Hawk 5. Ordered that the pedigree be corrected accordingly.

The Pilot Jr. Mares.

THE Pilot Jr. mare Waterwitch now has six of her produce in the 2:30 list, her son Warder having made a record of 2:29¼ at Meadville not long ago. These trotters that are out of Waterwitch are:

Viking.....	2:19¼	Mambrino Gift..	2:20
Scotland	2:22½	Waterloo	2:23¾
Wavelet.....	2:24½	Warder	2:29¼

With the exception of Mambrino Gift and Scotland these horses are by Belmont, who in turn was by Alexander's Abdallah, son of Hambletonian, and out of a mare by Mambrino Chief. Mambrino Gift was by Relf's Mambrino Pilot, saddle record 2:27½, and Scotland was by the imported thoroughbred race horse

Bonnie Scotland. But it is not alone in the production of 2:30 speed in the first generation that Waterwitch is celebrated, although what she has accomplished in that particular would suffice to keep her name prominent in trotting annals. As showing that her blood breeds on it may be said that her son Mambrino Gift who died while still young, is the sire of seven trotters with records of 2:30 or better, while three of his sons have sired 2:30 speed and five of his daughters have produced it. Warlock, another son of Waterwitch, has one 2:30 trotter to his credit, while daughters of Waterwitch have produced seven trotters with records of 2:30 or better, among them the promising young sires Egotist and Sphinx, both of whom are represented in the 2:30 list at a very early age. It was noted in these columns not long ago that in respect of producing 2:30 speed which bred on, and also in the matter of producing 2:20 or better speed, the daughters of Pilot Jr. made a better showing, numbers and opportunity considered, than the daughters of any other stallion, and as this might seem at first blush a rather strong statement to make in respect of the daughters of any horse, the following summary of what Pilot Jr. mares have accomplished has been prepared:

WATERWITCH, dam of Viking, 2:19¼; Mambrino Gift, 2:20 (sire of seven in 2:30 or better, two producing sons and five producing daughters); Scotland, 2:22¼ (gelded); Waterloo, 2:23¾; Wavelet, 2:24½; Warder, 2:29¼; Sprite, dam of Egotist (one in 2:30), 2:22¼; Sphinx (two in 2:30), 2:20½, and Spry, 2:28¾; Fairy Belle, dam of Fairy Gift (eleven in 2:30), 2:30, and Nymphia, 2:26¼; Peri, dam of Alice Tyler, 2:30, and Gen. Hancock (sire of one in 2:30); Naiad, dam of Stornaway, 2:26; Warlock (sire of one in 2:30).

MISS RUSSELL, dam of Maud S., 2:08¾; Nutwood, 2:18¾ (sire of sixty-seven in 2:30 list, fifteen producing sons and sixteen producing daughters); Cora Belmont, 2:24½ (dam of one in 2:30 list); Russia, 2:28; Lord Russell (sire of nine in 2:30 list); Mambrino Russell (sire of ten in 2:30 list, and four producing sons); Nutbourne (sire of two in 2:30); Nutula (dam of Maudlen, 2:25¾); Lady Russell, (dam of Re-Election, 2:27¼, and Electrix, 2:28½).

TACKEY, 2:26, dam of Pilot Boy, 2:20 (gelded); Naiad Queen, 2:20¼; Class Leader, 2:22¼; Pilot Medium (sire of twenty-seven in the 2:30 list, and one producing daughter); Tackey (dam of Onie D., pacer, 2:20).

SANTA MARIA, dam of Hylas, 2:24½ (sire of three in 2:30); Billy Hoskins, 2:26¼ (gelded); Josie Ralley (dam of Mistletoe, 2:30).

CROP, dam of Counsellor, 2:21¼ (sire of two in 2:30); Code, 2:22¼; Blanche Amory, 2:26; Brentwood (sire of one in 2:30); Gauntlette (dam of Brown, 2:18¾, Williams, 2:20½, Integrity, 2:27½); Ruth (dam of Boaz, 2:19¼); Mary Mason (dam of Omar, 2:25½).

DAHLIA, dam of Dalreen, 2:21½; Davenant, 2:26¼; Dacia, 2:29¼ (dam of Daciana, 2:27¼); Debutante (dam of Disputant, 2:29); Dalphine (dam of So Long, 2:17¼).

MIDNIGHT, dam of Jay-Eye-See, 2:10, 2:06¼, pacing (gelded); Electricity, 2:17¾; Noontide, 2:20½; Beaumont (sire of one in 2:30); Noonday (dam of Pastime, 2:27¼).

DIANA, dam of Lady Kelso, 2:29; George A. Ayer, 2:30; Bessie Forrest (dam of Alley Bonner, 2:28, and Geneva, 2:14¾).

DIXIE, 2:30, dam of Dixie Sprague, 2:25¼; Zephyr (dam of Baroness, 2:30).

PILOT ANNA, dam of Emperor Wilkes, 2:20¾; Banker Rothschild (sire of five in 2:30); Waveland Chief (sire of five in 2:30).

JUANITA, dam of Eula Lee, 2:29½; Loretta, dam of Redfield (pacer), 2:19; Wyoming Belle (dam of Wanita, 2:20½).

GREY FANNY, dam of Stonecutter, 2:28¾.

MOLLY TRUSSELL, dam of Trousseau, 2:28½ (dam of Bridal Bells, 2:27½); Tassell, dam of Twist, 2:26.

BRUNA, dam of Woodford Pilot, 2:23¼ (sire of two in 2:30); Sagerser (sire of one in 2:30); Roma (dam of Farce, 2:29¼, Romance, 2:29½, Guyon, 2:30, Fiction, dam of one in 2:30).

MINERVA, dam of Meander, 2:26½ (sire of four in 2:30); Nugget, 2:26¾ (sire of eight in 2:30); Egmont, (sire of thirteen in 2:30).

FINLEY, dam of May Bird, 2:23.

The Fastest Pacers.

NEWS comes from Butte, Mont., that at the recent meeting in that city the pacer St. Patrick reduced his record to 2:14½, which is a very respectable mark for any side-wheeler. The present season has been a remarkable one in respect of the production of phenomenal pacing speed, as never before was there on the turf such a quartette of sidewheel champions as Hal Pointer, 2:05¼; Jay Eye See, 2:06¼; Flying Jib, 2:07, and Robert J., 2:09¾, not to mention Direct, 2:06, who has gone some races against Hal Pointer, but is plainly not in condition to do himself justice. Noting the reduction of St. Patrick's record to 2:14½ recalls the fact that he is the only pacer got by the great sire of trotters, Volunteer, that horse's list at the close of 1891 including twenty-nine trotters with records ranging from 2:11¼ to 2:30, and only this solitary pacer, St. Patrick.

Considering the fact that Volunteer was foaled in 1854 and remained in the stud until age rendered him incapable of siring a foal, and also taking into account the fact that he was one of the greatest sires and progenitors of trotting speed of his day, it is rather remarkable that in the whole course of his long career in the stud he should get only one pacer to make a record of 2:30 or better, and it is also significant that this horse, which has now reduced its record to 2:14½, should be, in a measure, inbred, as his dam was by Guy Miller, a son of Rysdyk's Hambletonian, and as Volunteer was also a son of that horse, it will be seen that Volunteer's solitary pacer has more Hambletonian blood in his veins than most of the get of Volunteer that trotted in 2:30 or better, as, of the twenty-nine which come within this classification, it is found that only one, Amy, 2:20¼, is out of a mare by Rysdyk's Hambletonian. The fact that St. Patrick, a fast pacer and one of the race-horse variety, is strongly trotting-bred naturally calls attention to the great preponderance of trotting blood, generally of the developed brand, that obtains in a majority of the fastest pacers of the day. Until the pres-

Digitized by Google

ent month the pacing record, which was 2:06, made over a kite-shaped track, was held by the trotting-bred pacer, Direct, he being by a sire with a trotting record of 2:17 and out of a dam with a trotting record of 2:23½. Two weeks ago, however, the pacing-bred gelding, Hal Pointer, that is by Gibson's Tom Hal and out of a pacing mare by Snow Heels, reduced the pacing record to 2:05¼. A review of what has been accomplished by the pacers this season, however, shows conclusively that those with a considerable amount of trotting blood in their veins have done the greatest work, and makes inevitable the conclusion that for practical purposes there is no comparison between trotting-bred pacers and others, the former having so much the best of it that argument is not necessary. During the trotting season of 1892 three pacers that did not previously have records sufficiently fast at that gait to make them standard have beaten 2:10, and in every instance the performer is trotting bred. These horses are:

Flying Jib.....2:07
Jay Eye See.....2:06¼
Robert J.....2:09¾

The two-year-old pacing record was set at 2:16½ by Manager two years ago, and it has never been equaled, or for that matter approached until this year, when a two-year-old named Online beat the mile of Manager by going a mile in 2:16¼ at Independence. Online is by the trotter Shadeland Onward, 2:18½, and as showing that this horse is in a fair way to become noted as a sire of pacers it may be said that the champion half-mile track yearling pacing record, also made this season, fell to his daughter Belle Acton whose dam, however, was the pacer Lottie P., 2:17¼, by a son of Blue Bull. On August 26 Belle Acton lowered the yearling pacing record to 2:22½ at Independence. Taking the three horses mentioned above as having beaten 2:10 this season whereas at the beginning of the year only one of them had a record as good as 2:30, it will be found that their blood lines are pretty much of the trotting variety, Flying Jib being by Algona (son of Almont), and out of a mare by Middletown, son of Rysdyk's Hambletonian. Jay-Eye-See is by Dictator and out of a mare by Pilot Jr., while Robert J. is by Hartford, 2:22¼, and out of a mare by Jay Gould, 2:21½. Another great pacer of the present season is Expert Prince, 2:13¼. He is by Egbert, son of Hambletonian, and out of a mare by Edward Everett. Merry Chimes, that is only four years old, but that has made a record of 2:14¾ and distinguished hi at Cleveland by winning a seven-heat where all the miles were paced better 2:20, is by Chimes, 2:30¼, the well-known of Electioneer, dam by Blackwood Chief.

Taking the pacers that have come into list this year and have also made records ter than 2:20, it will be found that there good deal of trotting blood mixed up with t They are given herewith in the order of t records:

NAME.	Record.	Sire.	Sire of Dam.
Flying Jib	2:07	Algona	Middletown
Jay Eye See	2:06¼	Dictator	Pilot Jr.
Robert J	2:09¾	Hartford, 2:22¼	Jay Gould, 2:21½
Expert Prince	2:13¼	Egbert	Edward Everett
Diabolo	2:14¾	Chas. Derby, 2:20	Alcantara, 2:23
Merry Chimes	2:14¾	Chimes, 2:30¼	Blackwood Chief
Walnut Boy	2:15¾	Ferguson	Gen. Thomas
Rebus	2:15¾	Chesterwood	Miller's Hambletonian
Ella Brown	2:15¾	Prince Pulaski	
Henry O	2:16¾	Clipper	
Online (2)	2:16¾	Shadeland Onward, 2:18½	Chester Chief
Allen Lowe	2:16¾	Alcantara, 2:23	Happy Medium, 2:32½
Glendennis	2:17¾	Hamlin's Almont, 2:26	Hamlin Patchen
Linden	2:17¾	Madison Wilkes, 2:28¾	
Atlantic King	2:17¾	Atlantic, 2:21	Blackwood, 2:30
Charlie Ford	2:18¼	Dexter Prince	
Joe Jett	2:18½	Billy Wilkes, 2:29¾	Corsica
Wisconsin King	2:18¾	Wisconsin	
Turk	2:18¾	Tennessee Wilkes, 2:27	
Cleveland S	2:19¼	Montgomery, 2:21¼	Tippoo Saib
Lilly	2:19¾	Capt. Clay	
Fleetfoot	2:19¾	Clipper	
Kreeland	2:19¾	Hall Jurnigan, 2:18½	
Belle Acton (1)	[illegible]	[illegible]	[illegible]

Taking the complete list of 2:12 or bet pacers of the present year, it will be found th a good many of them are trotting-bred in t male line at least. Here is the list:

Name.	*Record.*	*Sire.*
Hal Pointer	2:05¼	Gibson's Tom Hal
Direct	2:06	Director, 2:17
Johnston	2:06¼	Joe Bassett
Jay Eye See	2:06¼	Dictator
Flying Jib	2:07	Algona
Roy Wilkes	2:08¼	Adrian Wilkes
Robert J	2:09¾	Hartford, 2:22¼
Cricket	2:10	Steinway, 2:25¼
Guy	2:10½	Shiloh
Gold Leaf	2:11¼	Sidney (p), 2:19¾
Red Bell	2:11¼	Red Wilkes, 2:40
Adonis	2:11½	Sidney (p), 2:19¾
Dallas	2:11¼	Almont Boy
Manager	2:11½	Nutwood, 2:18¾
Little Brown Jug	2:11¾	Gibson's Tom Hal
Strong Boy	2:12	Allandorf
Yolo Maid	2:12	Alexander Button, 2:2

Dash Races for Trotters.

"THERE seems to be only one cure for th jobbing business, and that is to abolish he racing," says the *American Sportsman*. Th utterance is in line with the ideas of a go

many people, and there can be no question that in the near future the dash-race system as applied to trotters will be given a fair and comprehensive trial by some leading trotting track.

As the programs of trotting meetings are now made up a vast majority of the events are of the three-in-five variety, and while it is unquestionably true that they furnish a fair amount of sport, it is also apparent that the public which pays its dollars at the gate does not particularly admire a long-drawn-out race of from five to eight heats, lasting from early in the afternoon until the sun has gone down, and affording illimitable opportunities for chicanery and fraud. It is a settled fact that in large cities like Chicago and New York, that portion of the public which contributes liberally to the maintenance of the running turf and furnishes thousands of spectators every day looks with disfavor upon trotting contests for the simple reason that they are too prolonged and that the opportunities for jobs in the interest of the pool box manipulators are entirely too numerous and easily taken advantage of. The past month witnessed the first financially successful trotting meeting of any magnitude that has been given in Chicago for a good many years, and it was also marked by the advent of half a dozen bookmakers, where previously only two—who practically were allied to the management of the pool box—had appeared. The Chicago public is addicted to betting on dash races, and supports three running tracks in the most lavish fashion. By securing the closing of the running tracks during the week of the trotting meeting the management of that enterprise was enabled to draw a certain proportion of people who would otherwise have been in attendance on the runners, and this contingent quickly showed that it appreciated the opportunity to bet on heats by forming a compact mass in front of the six bookmakers and wildly struggling to get its money on. It is the universal testimony that twenty bookmakers would not have been too many for the business offered at the Northwestern Breeders' Trotting meeting.

Under the auction pool system a man who wants to back a favorite must, to begin with, invest from $25 to $100 in order to get a single ticket on a horse he likes, and having done this he must either sit still until the race is decided if things go his way, or put up another considerable sum of money in order to protect his original venture from the machinations of certain drivers or the fluctuating possibilities of fortune as exemplified in heat races. At the best the horse he has selected must beat all the others three times in order for the bettor to win, and while to those who have followed the old system ever since they had any knowledge of the trotting turf this may seem well enough, it is, nevertheless, a fact that the present generation of race goers view it with positive disfavor and will persistently decline to attend meetings where the only method of wagering money is in the auction pools, and where no decision is had until three or more heats have been trotted. A move in the right direction has already been made by the Kentucky Trotting Horse Breeders' Association, which has reduced the number of heats necessary to be won in some of its events and has declared that the horse not winning a heat in three shall go to the barn. Seeing the result of the bookmaking system of betting at the Washington park trots in this city, one man who is prominent in the management of the Kentucky Association declared that so far as his interest went there would in the future be nothing longer than two-in-three heat races and that he should strongly advocate making all events dashes just as is done on the running turf.

On the other hand breeders whose views are not to be lightly tossed aside are firm in the belief that the dash system means the placing of the trotting turf on the level of a mere gambling machine, and they oppose it for this reason. This argument may be true, and it is not a certainty that for all classes of meetings the dash system is necessary to a successful financial consummation of the venture, but in cities of any consequence it will unquestionably be found that what the people do not like they will not patronize, and that so long as the running turf affords them an opportunity to bet in the manner they approve of they will keep away from the trotters and the system of betting which involves the placing of a large amount of money in order to wager anything at all upon a favorite, and also leaves the public's bets exposed to the assaults of unscrupulous men who are driving horses in the race.

Death of G. Valensin.

In the last Monthly appeared a picture of W. H. Wilson, the same accompanying the announcement of his death, and with the current issue of this journal it becomes necessary to chronicle the demise of another

Digitized by Google

well-known breeder, Mr. Guilio Valensin, having died in Cleveland on August 15. For the last year and a half Mr. Valensin's health had been far from good, and about twelve months ago he went to Europe in the hope of recuperating, but his return to this country did not find him materially improved, and since then he has steadily failed in strength.

Mr. Valensin was perhaps best known as the owner of the phenomenal sire Sidney, a horse which he selected when the blood lines composing his pedigree were not thought to be particularly strong. Santa Claus, the sire of Sidney, was, to be sure, a richly-bred stallion, and as a racehorse he had few equals. The dam of Sidney was the developed trotting mare Sweetness, 2:21¼, by Volunteer. Sidney traces three times directly to Rysdyk's Hambletonian, with Clay blood as an added strength, and after he began siring extreme speed at both the trot and pace it was easy enough to see that his blood lines were unexceptionable, although they had not so impressed his breeder, a man of experience, who sold him to Mr. Valensin for a modest sum. Previous to this Mr. Valensin, who was born in Florence, Italy, in 1851, and who came to this country about fifteen years ago, had dabbled to a considerable extent in the business of breeding light-harness horses, having owned the stallions Buccaneer and Crown Point. Sidney, however, was, of course, the means of his greatest triumphs as a breeder, that horse having sired during the first ten years of his life ten trotters with records better than 2:30, and five pacers that have performed in 2:20, or better. Last fall, while Mr. Valensin was in Europe, the greatest honors that had yet fallen to Sidney came to him when his yearling daughters, Frou Frou and Fausta, lowered the records for trotters and pacers of that age to 2:25¼ and 2:22¾, respectively. This phenomenal exhibition of precocious speed, backed up as it was by such pacers as Goldleaf and Adonis, both of whom have records better than 2:12, and a strong showing of trotters, placed Sidney in the front rank of sires, age considered, and, as his breeding is of the best, it is not remarkable that an offer of $125,000 was made for him last winter. This was refused by Mr. Valensin, but subsequently his rapidly failing health caused the California breeder to change his plans regarding Sidney, and only ten days before his death he executed a three-year lease of the horse to Mr. W. C. France, the well-known Kentucky breeder, who is also the owner of Red Wilkes. In a letter to the editor of the MONTHLY, Mr. France says that he secured Sidney chiefly to cross upon his mares by Red Wilkes, believing that such a combination would produce extreme speed of the race-horse variety, the two stallions named, albeit of the same family, possessing such marked characteristics and being withal such great individuals and so wonderfully prepotent that from the union of their blood could hardly fail to spring a family of notable performers.

The Trot and the Pace.

So much has been written of late about the interchangeability of the trotting and pacing gaits and so many horses are being shifted from trotting to pacing this season that the subject is one of interest to all horsemen and breeders.

It is not so many years ago that the skill of trainers was continually directed to changing the gait of horses that were natural pacers, so that by the application of weights on the forward feet or the use of hobbles they could be made to assume and maintain a trot. In those days pacers were deemed of little value, the purses offered for speed of that character being small in amount and few in number, but with the advent of pacers like Sleepy Tom, Mattie Hunter, Rowdy Boy, Lucy, and a few others that could and did beat 2:15 in races, it was very soon demonstrated that liberal purses for pacers would bring out good fields of remarkably speedy animals and insure contests which in the way of uncertainty as to the ultimate winner—which is what the public dearly loves—could not be equaled in any other way. The offering of a considerable amount in purses for pacers naturally created a demand for horses capable of winning such races, and it was soon found that when trotting-bred animals that took naturally to the pace were allowed to maintain that gait and were trained at it they developed as much or more pacing speed than those in whose veins there was a considerable preponderance of what may fairly be termed pacing blood. The discovery of this fact and the knowledge that the market for horses which in order to attain a creditable rate of speed at the trot were obliged to carry toe weights and other appurtenances was rapidly tending downward, because so many pure-gaited ones were being brought out every year, very soon brought about an abandonment of the old plan of trying to make trotters out of pacers, and the

Digitized by Google

general adoption of the idea that inasmuch as a good pacer could win about as much money as a trotter of similar speed it was wisdom to let horses which paced naturally retain that gait. Pacers the top crosses in whose pedigree were those of well established families, soon became so numerous and performed so creditably that the old-fashioned, slope-rumped, side-wheeler is now as much of a rarity as a trotting-bred pacer was a decade ago.

It has also been the experience of most trainers and drivers that in a great many cases horses which trot without toe weights, but that are at times inclined to amble or mix a little, may be made by the use of hobbles to assume the pacing gait and after a little education maintain it. In this way quite a number of horses have made creditable records at both the trot and the pace. A casual examination of the records to the close of 1891 shows that up to that time twenty-one animals had made records better than 2:30 at both the trot and pace, while Fred Arthur, just outside the 2:30 trotting list, with a record of 2:31¾ stands well up among the pacers with a mark of 2:14¼. In addition to this it may be said that Brown Hal, a stallion whose pacing race record is 2:12½, and who is pacing bred, was also a fast trotter, and during at least one season was trained at that gait and showed the ability to step a mile close to 2:20. Johnston, who held the pacing record with his 2:06¼ performance until Direct came along, could trot a 2:40 gait without any handling, and his full brother is the trotter Brother Dan, record 2:23½. The California stallion Sidney, that is well known as a phenomenally successful sire for his age of both trotting and pacing speed, was trained when a three-year-old for a trotter and could show well at that gait, but was faster at the pace and took a record of 2:19¾ at that way of going after very little handling. His daughter Fausta, who holds a yearling pacing record of 2:22¾, was a remarkably fast trotter for that age and worked a trial mile in 2:40 on a trot, which in itself is an extremely creditable performance for a yearling, although of course not to be compared to her 2:22¾ mile as a pacer at the same age. As showing what has already been done in the way of beating 2:30 at both the trot and pace, the following list is given. It demonstrates conclusively that in the cases of nearly a score of horses the trotting and pacing gaits are interchangeable to a great degree. This season has already witnessed the most remarkable instance on record of the possession of extreme speed at both the trot and pace, the little black gelding, Jay Eye See, that close to a decade ago held the world's trotting championship with a record of 2:10, having paced a mile over the Independence, Iowa, track, in 2:06¼. The list is as follows:

NAME.	Sire.	Sire of Dam.	Pacing.	Trotting.
Belle Shackett	Abraham	Ethan Allen	2:27¾	2:26¾
Ben Starr	Tom Hazzard	John Richards Jr.	2:19¾	2:21¾
Charley M.			2:26	2:24¾
Charley P.	Gov. Sprague	Rothschild	2:16	2:25¾
Chimes E.	Chimes 1072	Louis Napoleon	2:15¾	2:28¾
Defiance	Chieftain		2:17¾	2:24
Despot	Dictator	Ray Munson	2:24½	2:29
Direct	Director	Echo	2:06	2:18¾
Fred Arthur	Belmont	Blue Bull	2:14¼	2:31¾
Ira Wilkes	George Wilkes	H. B. Patchen	2:22¾	2:28
Jewett	Allie West	John Innis	2:14	2:20
Ky. Ruler	Egbert	Almont	2:24	2:29
Kinsman	Stranger	Young Country Boy	2:17¾	2:23¾
Lady Rolfe	Tom Rolfe	Montezuma	2:23	2:22¾
Lexington Chief	Aristos		2:23¾	2:30
Little Rock	Bullet		2:26	2:29¼
May Eddy	Jerome Eddy	Young Dick Taylor	2:22½	2:27¼
Mike Wilkes	George Wilkes	H. B. Patchen	2:15¾	2:26¾
Minnie R.			2:16½	2:19
Reno's Baby	Reno Defiance	McKinney Horse	2:24¾	2:25¼
San Diego	Victor		2:21	2:25¾
Windsor H.	Windsor	Selim	2:22½	2:25¾

One feature of this list which can not fail to strike the notice of even a casual observer is that at least one-half of these horses that have made creditable records at both the trot and pace are what would be termed trotting-bred, notable instances of this being Charley P., Chimes E., Despot, Direct, the brothers Ira and Mike Wilkes, Kentucky Ruler, May Eddy and Reno's Baby. The present season has brought out as superior to all other pacers, except perhaps Hal Pointer and Direct, and certainly worthy competitors for even these horses, two geldings called Robert J. and Flying Jib. These pacers are deeply bred in trotting lines, as a brief summary of their pedigrees will show, Robert J. being by Hartford, 2:22½ (son of Harold and Judith by Mambrino Chief); dam by Jay Gould, 2:21½; while Flying Jib is by Algona (son of Almont, dam by Conscript); dam by Middletown son of Hambletonian, 10. Robert J. made a race record of 2:09¾, while Flying Jib, as yet unbeaten, has a race mile in 2:07, and a fourth heat in 2:12. Another pacer that has made a race record better than 2:14 this season

Digitized by Google

is Expert Prince, a son of Egbert, dam by Edwin Forrest. Pacing performers of less note that are deep in trotting strains might be mentioned in considerable numbers, but when the test is confinedto new comers to the 2:20 list of pacers and those with race records showing remarkable capacity, the fact that trotting blood figures so largely in their pedigrees is deeply significant.

Three Records Lowered.

SOME wonderful trotting and pacing was done at the Independence kite-shape track August 26. In the free-for-all race the great mare, Martha Wilkes, that already had a race record of 2:12, made on the oval track at Grand Rapids, Mich., had for contestants the Canadian stallion Alvin, race record 2:13¼, made the previous week at Chicago; Vic H., the California mare that last season went into winter quarters with the best three heats in a race to her credit, and Charleston, record 2:15. In the first heat there was the semblance of a contest between Martha Wilkes and Alvin until the home stretch was reached, when the mare pulled away as she liked and won in 2:12, equaling her own previous race record, which honor of a mile in 2:12, while contending against other horses, she shared with Nancy Hanks and Delmarch. But in the next two heats Martha Wilkes left the others from the start, trotting the miles in 2:10, 2:09½, making three race heats that average 2:10½, beating in two of these heats the best previous record ever made by a trotter in a race and equaling it in the other. It was a grand performance, worthy of the great mare that Martha Wilkes has shown herself to be, and the highest tribute that could be offered to the skill of her trainer and driver, Mr. Budd Doble.

But there were other record-breaking miles at Independence the same day that Martha Wilkes went so well, and in the second instance the new champions were pacers—a yearling and a two-year-old, both by the trotting stallion Shadeland Onward, 2:18½. The youngsters are Online and Belle Acton, referred to elsewhere in this issue of the MONTHLY. Online is a two-year-old, and, with the inspiration of a runner at his side, he paced a mile in 2:16¼, one-fourth of a second faster than the record made by Manager when the gray son of Nutwood and a George Wilkes mare was a two-year-old. Then Belle Acton, a yearling pacer by Shadeland Onward, that already had the pacing record for her age over a half-mile track, 2:25½ to her credit, essayed to beat the 2:22¾ of Fausta, made last year, and again was a quarter of a second the margin by which the work was done. Online's dam is by Chester Chief, a son of Hambletonian 10, while the dam of Belle Acton is by a son of Blue Bull and has a pacing record of 2:17¼. Developed speed figures conspicuously in the pedigrees of these fast young pacers, as it also does in the male line of the pedigree of Martha Wilkes, she being by Alcyone, 2:27, son of George Wilkes, 2:22, while her dam was by Clark Chief, son of Mambrino Chief.

Trials Against Time.

DURING the months of September and October there will be thousands of trials against time in various parts of the country for the purpose of admitting to standard rank horses whose owners do not care to trot them in races. In order that persons intending to make such trials may go about the matter in the proper way, the MONTHLY herewith prints the conditions under which such efforts to obtain records will be recognized for purposes of registration by the American Trotting Register Association:

Must be made at a regular meeting of a society in membership with the National Trotting Association, or American Trotting Association, said performances to be conducted by the regular appointed judges and timers for the day, strictly in accordance with the rules of said National or American Trotting Association adopted by the member.

No animal shall be permitted to start against time pending a heat or trial by another animal, nor until the result of such heat or trial shall have been duly announced.

Time shall be taken by not less than two, nor more than three timers engaged in the stand at the same time.

There shall be not less than three judges during such performances, who shall not act as official timers.

No performance against time will be accepted if made before the regularly announced time for the commencement of the performances of the day, which shall not be earlier than ten o'clock A. M.

No performance against time will be accepted if made at a postponed or continued meeting, unless such postponement or continuance is made in accordance with the rules of the National or American Trotting Association to which the member belongs.

No performance against time will be accepted unless the animal starts to equal or beat a specified time and accomplishes the feat.

A regular meeting is hereby construed to mean a meeting advertised in at least one newspaper not less than one week before the commencement of said meeting, and at which meeting no less than two regular events (purse

stake) take place on each day, to which en-
nce fee is paid or subscription made.
Entries to "performances against time"
ust be made with the secretary not later than
ven P. M. the day before the performance.
Time made in match races between two or
ore horses will not be accepted, unless made
er grounds of members of the National or
merican Trotting Association, said races to
conducted by the regularly elected or duly
pointed officers of said member, strictly in
cordance with the rules of said National or
merican Trotting Association.
Time made in "matches against time" will
t be accepted for purposes of registration,
cept as hereinbefore provided.

Two Records Broken.

SINCE the last issue of this journal both the
otting and pacing records have been lowered,
ancy Hanks reducing the former to 2:07¼
the Northwestern Breeders' Association
eeting in Chicago, August 17, and on the last
ay of the month trotting the kite track at
ndependence in 2:05¼, beating the kite-track
cord of Sunol a full three seconds, and plac-
g the trotting and pacing records on an
quality. During the Chicago meeting
al Pointer pulled the pacing mark
own three-fourths of a second—from 2:06 to
05¼. Incident to these remarkable perform-
nces there has been a great deal of talk as to
he relative value of records made over kite-
hape and oval tracks, as well as any amount
f discussion about the guesswork idea of how
uch difference a pneumatic-tire sulky makes
n favor of a horse trotting in 2:08 or better.
It was at once suggested, when Nancy Hanks
rotted the Washington Park track in this city
n August 17, in 2:07¼, that Mr. Robert Bonner,
he owner of Sunol, from which horse the cham-
pionship honors of a kite track were taken,
ould argue that there was more than a second
difference between a pneumatic sulky and one
f the old-fashioned kind. Also it was said that
Mr. Bonner would contend in favor of still hold-
ing the 2:08¾ mark of Maud S. over the oval
rack at Cleveland as better than the perform-
ance of Nancy Hanks, for the same reason.

But Mr. Bonner did nothing of the kind, frankly admitting that the most perfect appliances which could be obtained ought to be used in trials against time. It is unquestionably true that the pneumatic-tire sulky is of some advantage to all trotters and pacers, and a great help to a good many. With a pure gaited horse whose perfect motion tends to make him tire more quickly than would an animal with a less rhythmic way of going, the pneumatic sulky is indeed a boon, as by its use the holding power of the man and vehicle is practically done away with. Mr. Doble does not question that a pneumatic sulky is of advantage to Nancy Hanks, but he does not undertake to say how little or how much this advantage would amount to if it were possible to express it in seconds or fractions thereof. It is, of course, at the present time mere guesswork, this figuring on the difference a pneumatic sulky makes in the speed of any named horse, and yet men who are actuated by a partisanship which is often allied to sycophancy are first and most blatant in their efforts to show that, because Nancy Hanks trotted in 2:07¼ over an oval track and hitched to a pneumatic sulky, on account of the use of the rubber tires filled with air her performance was not as good as that of Sunol, which is a full second slower, or of Maud S., a second and a half slower. This is the silliest sort of bosh to be spreading before the public, and the sooner it is stopped the better for the light-harness horse interest. Maud S. made her record a long time ago, and it stood unequaled until Sunol trotted in 2:08¼ last year. Mr. Bonner owns both Maud S. and Sunol. He does not think that the 2:08¼ record of the California-bred filly over a kite track is as good a performance as the 2:08¾ record of Maud S. on the oval at Cleveland years ago. Mr. Bonner's views are coincided in by a good many other people, who believe that a kite track is more than half a second faster than an oval. Yet, on the contrary, so conservative a man as Budd Doble is free to say that at least one fast horse in his stable, McDoel, could not trot the kite at Independence year before last any faster than he could the oval at Chicago. Mr. Bonner, with his inevitable good sense, says that the pneumatic sulky is now a part of a trotter's outfit; that he would be the last man in the world to say anything against the performance of Nancy Hanks, and that he hopes to demonstrate the superiority of Sunol by hitching her to a pneumatic sulky before the season closes and letting her trot a mile at her best rate. That is the way to talk. Nobody cares about the figures of people as to how much faster Nancy Hanks goes to a pneumatic sulky than one of the ordinary pattern. There are plenty of pneumatic sulkies in the country, and when Sunol is hitched to one of them and beats Miss Nancy's record the American public will be quick to appreciate the fact and extend the credit that is due.

Digitized by Google

But to those who take an interest in the

breeding of the American trotting horse it is a significant fact that these record breakers are by sires of one family, that founded by Rysdyk's Hambletonian—Nancy Hanks being by his son Happy Medium and Sunol by his son Electioneer. At this point the similarity in the breeding of the mares ends, as Nancy Hanks has for her dam a mare by Dictator, another son of Hambletonian, while the dam of Sunol was by Gen. Benton, who does not trace to Hambletonian. It is not to be overlooked, however, that both the sires of Nancy Hanks and Sunol, and the sires of their dams, were in their day fast trotters, and in some lines of the pedigrees of these two great mares the presence of more than usual speed at the trot is well established in even more remote generations. Happy Medium, the sire of Nancy Hanks, obtained a record of 2:32½ as a four-year-old about twenty years ago, when that rate of speed in a horse of his age was more remarkable than 2:20 would be at the present time. More than this, Happy Medium had for his dam the trotting mare Princess, who, although her record was only 2:30, frequently showed the ability to beat that mark by at least five seconds, in addition to which she was a famous performer at five miles and upward. Rysdyk's Hambletonian, who sired Happy Medium, was certainly considerable of a trotter in his day, as after he had passed his prime he was frequently driven to a wagon by so good a judge of speed as Mr. David Bonner, and that gentleman avers that Hambletonian was capable of showing a strong 2:40 clip down the road even at that period of his life. It cannot therefore be said that Happy Medium's speed, which in its day was of a high order, was an accident, because both his parents were trotters, one of them being deemed a phenomenon. Happy Medium was a remarkably uniform sire of trotting speed, having at the close of 1891 sixty-six trotters and three pacers standard by performance, and two of his get, Nancy Hanks and Maxie Cobb, have records better thon 2:15. Dictator, who sired the dam of Nancy Hanks, was in his youth a horse of remarkable speed which came to him rightfully by inheritance, he being a brother of Dexter, 2:17¼, the unquestioned trotting champion of his day. It was the testimony of the late George H. Brasfield, a man whose word was never doubted by those who knew him, that after being taken to Kentucky Dictator could show a 2:20 gait right in stud condition, and that he had a rare turn of speed when kept on Long Island can be testified to by Col. John W. Conley, of this city, who knew all about Dictator at that period of his life. Electioneer, the sire of Sunol, could trot a 2:20 gait after being taken to California from New York. This statement is made on the authority of Mr. Charles Marvin. Gen. Benton, who sired the dam of Sunol, was driven a public mile in 2:20½ over the Utica track in the presence of hundreds of people by the late J. H. Phillips, and Budd Doble, who took Gen. Benton to California for Senator Stanford, is also personally cognizant of the fact that he was a horse of great speed. These facts are mentioned in detail here because these daughters of Happy Medium and Electioneer will always be prominent in trotting history, and it is important that all the facts which can be properly established, whether they are on the records or not, should be chronicled in such manner that their preservation is assured. It happens that this may now be done, and it is well that all should know something of the immediate ancestors of these two great trotting mares, as although Sunol had for her second dam a thoroughbred mare, and Nancy Hanks traces to the thoroughbred in the distant lines of her pedigree, the evidence is clear that their immediate ancestors were possessed of far more than average speed at the trot.

In regard to the mile in 2:07¼ by Nancy Hanks, it is only necessary to say that she was driven by Mr. Budd Doble and that the quarters were :31½, :32¼, :32¾, :30¾, the last quarter being the fastest of the four, and at the finish the mare was probably going close to a 2:00 gait. When Sunol trotted the kite track at Stockton, Cal., last fall in 2:08¼, her quarters were :31¾, :32¼, :33, :31¼. The quarters of the 2:08¾ mile of Maud S. in 1885 were: :32¾, :31¾, :31, :33¼. This shows that Nancy Hanks not only went the last quarter of her mile faster than either Sunol or Maud S. went any quarter of their best miles, but also that she was admirably rated by that king of reinsmen, Budd Doble. Maud S., on the contrary, when she trotted in 2:08¾ at Cleveland, was very badly driven on the third quarter, which includes a turn, as she stepped it in thirty-one seconds, the effort taking so much out of her that she could only go through the homestretch in thirty-three and one quarter seconds—a 2:13 gait. In fact Bair drove Maud S. wretchedly on this occasion, as the first quarter was trotted at a 2:11

Digitized by Google

it, the second at the rate of 2:07 to the mile, third at a 2:04 clip, and the last at the rate 2:13. The mare trotted the middle half of mile, from the quarter to the three-quarter le, in 1:02¾, and the other half—the first d last quarters—in 1:06. It is well for Bair at Maud S. fell into his hands, as otherwise would never have risen from the obscurity ich enveloped him previous to the purase of the mare by Capt. Stone, of Cincinti, and into which he immediately plunged hen Maud S. passed out of his hands. It is thousand pities that so great a trotter, ch a beautifully formed mare, and one so ell bred, could not have had when at her best assistance of an artist in the sulky instead being handicapped by a man who, although had for years the benefit of working under good a trainer and reinsman as the elder oble, never rose above mediocrity in his osen line of work.

The Chicago mile was such a great one, d the record was lowered so handily that though the general public seemed to think e limit of the mare's speed had been reached, orsemen were confident that with a good day Independence she would step the kite-haped track at that place even faster than she ad the well kept oval at Chicago. In this alculation they were right, as with everything her favor on the last day of August Nancy id the trick and placed the trotting record at :05¼, stepping the first quarter in 30 seconds, he fastest one ever trotted, the half in 1:01, he three-quarters in 1:34 and the mile in 2:05¼. t will be noted that the third quarter was one at a 2:12 gait only, which is due to the act that the wind affected her most in that uarter. On the same day the California acer Flying Jib paced the third heat of his ace in 2:07, establishing a new race record for ide wheelers and placing himself fifth on the ist of pacers, Hal Pointer, Direct, Johnson and ay Eye See preceding him.

Notes and News.

THE Mambrino King mare Henrietta, that recently made a record of 2:17 at Rochester, is in foal to Chimes, and would not now be in training had it not been thought that a different state of affairs existed.

WHEN Bob Stewart drove his horse Walter E. in 2:13¾ at Rochester, the fastest time ever made in a race on a grand circuit track, wr the most pleased man on the grounds and said he would not take $1,000 and have the mark rubbed off the books.

BANGOR, Me., Aug. 31.—At the eastern Maine state fair this afternoon, the stallion Nelson was sent to beat the world's record of 2:15¼ on a half-mile track made by him here two years ago, and trotted the mile in 2:13¾.

LETTA, 2:28½, has a filly foal by Sphinx, 2:20¼.

HICKOK says that Whips will prove the greatest son of Electioneer as a sire of speed.

PROCTOR, that has been winning pacing races at the Illinois meetings, is by the trotter Pancoast, 2:21¾.

THE two-year-old filly Gipsy Girl, that has been doing some sensational trotting in her work at Lexington, has been purchased by A. H. Moore, the millionaire Pennsylvania breeder.

TYCHO, 2:28¼, a son of Jerome Eddy, 2:16½, that entered the list last year, has gone wrong and been thrown out of training.

THE pacer Lucile, a daughter of the trotter Wedgewood, 2:19, has reduced her record to 2:16¾.

CZAR, one of the best three-year-old trotters out this season and whose record of 2:19¼ was made in the fourth heat of a winning race, has sprung a tendon and been let up.

LYCURGUS, a son of Aberdeen that is hardly larger than a pony and that beat 2:25 a little last season, recently reduced his record to 2:19½ in a race.

MURTHA, by Stamboul, now has a record of 2:20, made this season.

GAMBETTA WILKES, well known as a phenomenal sire of speed, mostly of the pacing variety, is booked to beat 2:20 this year. He now has a mark of 2:22½.

BOURBON WILKES has had three of his get enter the 2:30 list this year. Last season Charleston, 2:15, and a great race horse, was his strong card.

THE pacer Dora Martin, that made a record of 2:20 at Versailles, Ky., the other day and that is only three years old, has for her sire the trotting-bred stallion Petosky, a son of George Wilkes.

JENNY WREN, 2:17½, pacing, has been bred to Coastman, 2:16½, also a sidewheeler.

SADIE M. has joined Turner's stable after showing a half in 1:06.

ST. PATRICK, 2:34, a Canadian-bred trotter that at one time could go close to 2:20, died at Detroit not long ago.

Digitized by Google

THERE is a fast pacer in Kentucky that is by Don Wilkes and out of the mare that produced Sudie D., 2:35¾, trotting, as a yearling.

A SUCKLING colt by Guy Wilkes, 2:15¼, and out of the dam of New York Central, 2:15½, died recently at the Hobart farm in California.

THE Dictator filly Twinkle, that went a mile in her work in 2:17¼, has gone wrong, and been turned out.

THE brown stallion Watchword, by Nil Desperandum, 2:24, and out of Daisydale, 2:19¾, won a heat in 2:20 at Knoxville, Iowa, not long ago. He was sold at Cleveland last fall for a few hundred dollars.

LIZZIE GIBSON, 2:29¼, died at Springfield, Mass., last week.

THE big chestnut pacer Chris Smith, that is by Guy Wilkes and out of the old pacer Lucy, 2:14, was started in a race at San Francisco a couple of weeks ago, but on account of a game leg that has troubled him for years he was not prominent in any of the heats.

THE stallion Reward, a son of Bourbon Wilkes and out of Lark, by Abdallah Mambrino, made a record of 2:29 at Versailles, Ky., recently, and is the fourth of the produce of his dam to beat 2:30.

DURING the recent meeting of the Northwestern Breeders' Association at Chicago, Mambrino Swift, two years old, made a record of 2:26¼ and Mambrino Queen, three years old, took a record of 2:20¼. These young mares are full sisters, being sired by Elyria, 2:25¼, dam Schaible girl. Schaible Girl is but seven years old, being the first mare at that age to have a two-year-old and a three-year-old in the 2:30 list. She was bred and is still owned by Schaible Brothers, of Elyria, Ohio. She was sired by a son of Blue Bull, called Bobby, that was owned and trotted in northern Ohio, but was afterward castrated and taken to Canada; her dam was sired by White Line, 2:30. But one other mare, Lady Pepper, by Onward, has entered the great broodmare list at seven years of age, but both her performers were three years old when they entered the 2:30 list.

FOR the benefit of thousands of people who have become interested in the American trotting horse and his breeding during the last decade or so, it may be said that Rysdyk's Hambletonian, unquestionably the greatest progenitor of trotters, died in March, 1876, having made twenty-four seasons in the stud. In all 1,931 mares were known to have been bred to him, and from this great number of matings 1,336 foals resulted. It is plain, therefore, that it will be only a few years when the last of the sons and daughters of Hambletonian will have passed away, the latest of his get having been foaled in 1876 and very appropriately named Hambletonian's Last. It is of interest, as showing that the old horse, even when at the edge of the grave, imparted speed, that Hambletonian's Last made a record of 2:25¼ at the age of eight years, but he has not yet accomplished anything as a sire of speed, although now sixteen years old.

THE down-east pacer Allen Lowe, that like most of the trotting-bred sidewheelers has been doing extra well this season, has joined Turner's stable, having changed hands a short time ago. Turner is not accomplishing as much this season as he usually does with his horses, and no doubt the conviction is coming home to him that now that practically all the best horses on the turf are owned by breeders it is not possible for a man with a public stable to cut as wide a splurge as was formerly the case. Turner and all the rest of the drivers are learning that the methods of thirty years ago in horse trotting will not do and that at the present time there must be a radical change. Horses are now bred with so much natural trot that it is not much of a trick to develop their speed and drive them in races. Judges are very different in caliber from the wobbly individuals that so frequently ornamented the stand only a few years ago and the cunning driver, whose scheme is to win a heat here and drop one there, help this horse and stop another, has no chance in these days to practice his little arts to anything like the extent that was possible only a short time ago. Turner will have to come in out of the rain if he doesn't want to get wet, but as he has moved in one rut for a matter of forty years the chances are that he is too old to be able to get out of it so that his gradual decline, rather than complete extinction may be looked for.

IT has been generally understood that Honest George, one of the season's sensational trotters, was by an Indiana stallion called Albert, but Mr. C. J. Hamlin, who owns Honest George, says that nothing is known concerning his breeding.

Volume XI.

Volume XI, Wallace's American Trotting Register is now in the hands of the binder and will be ready for delivery in a few days. Price $5 postpaid. Orders will be promptly filled. It will contain pedigree and description of Standard Stallions Nos. 16382 to 19801, and of Standard Mares and Geldings. Also the usual Non-Standard departments and Record of Official Transfers and Corrections and Index to Breeders, Owners, etc. Send New York or Chicago draft or postoffice order payable to American Trotting Register Association.

Humphreys' Veterinary Cure Oil

Has now become the STANDARD REMEDY among the thousands of stable and stockmen acquainted with its use. Nothing has ever been produced so simple in application, so promptly and widely and wonderfully curative in its action as HUMPHREYS' VETERINARY CURE OIL. It has more than justified the highest expectation of its sponsors, and justly stands at the head of all curative applications. Is the best possible application and cure for Harness, Collar or Saddle Galls or Chafings, Injuries, Lacerated, Torn or Cut Wounds; Sores, or Indolent Ulcers; Sore, Scabby, Itching Patches or Bare Places on the Skin; Sore Teats; Fistulas; Broken Knees or Open Joints; Old Sores; Hot Swellings; Boils or Tumors; Scratches; Greased or Cracked Heels; Broken Hoofs; Sand or Quarter Crack; Corns; Ill-growing Hoofs, etc., etc. AS A HOOF OIL IT IS UNEQUALED.

Questions and Replies.

SUBSCRIBER, PALMER, MASS.—1. Please inform me if Roxy (trotter) by Privateer (runner) will be eligible to registration as a standard trotter or pacer, if her pacing son by Montezuma, 2:29¼, gets a record of 2:22, and will the trotting produce by trotting standard sires be eligible to registration as standard? 2. Should the son get a pacing record of 2:22 will the dams be standard before being registered as standard? 3. Is any animal a standard trotter or standard pacer before being registered as such?

ANSWER.—1. She is not entitled to registration as a standard trotter unless she has a trotting record of 2:30 or better or produces a trotter with a record of 2:30 or better. She is not eligible to registration as a standard pacer unless she obtains a record of 2:25 or better pacing, or produces a pacer with a record of 2:25 or better. After she is registered as a standard trotter all her foals by a standard trotting sire are eligible to registration as standard trotters. If she is registered as a standard pacer her foals by standard trotting sires or by standard pacing sires are eligible to registration as standard pacers. 2. No. Every animal must be registered in its own right and under its own name before it becomes standard. 3. No.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal*. The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ABBA, (6) bl m foaled 1886; by Lumps 3922; dam Star, by North Star Mambrino 620; g d Lou, by Lexington Chief 576, etc. [See Star.] Bred by J. H. Bryan; foaled the property of Graham & Conley, Lexington, Ky.; passed to C. A. Campbell, Boston Mass. [Vol. XII.]

Wallace's Year Book for 1891, price $2.50. Volume X., American Trotting Register, price $5.00. Other standard horse and turf publications at lowest prices.

McFADDEN'S PEDIGREE BLANKS.

Every breeder of good stock should use them. The most simple, compact and correct method of recording pedigrees ever used. Published in book form, neatly bound in cloth, 100 pedigree blanks in each book. Price, $1.00 per copy, sent postage paid, to any part of United States or Canada. Send for illustrated circular to O. A. McFADDEN, Portland, Maine.

Columbia Pneumatic Tires

..ON..

SULKIES

are the ones that win the races, saving 2 to 4 seconds to the mile.

Elliott hickory wheels and ball bearings contribute their share to this remarkable work, as well as the famous Columbia Bicycle Tires.

The new sulky is the topic of the day, and the horsemen are straining every point to obtain possession of one. I have had 20 offers for mine, and every one else that got in early is envied. They are simply a wonderful invention, and are bound to revolutionize racing.
Allen Lowe, in Boston Globe.

Price of wheels complete with tires, bearings and forks, axle socket, ready to be fitted to sulky.....*$100 00*

THE METHODS OF PALO ALTO.

BY S. T. H.

VII.

THE selection of foundation stock for Palo Alto was almost exclusively the work of Governor Stanford. His knowledge is the combined result of experimental and theoretical wisdom. He mastered the anatomy of the horse, and studied his physiology till he could dissect and reconstruct the organism, and, as he sincerely believes, determine the sources of his speed. No breeder, judging from the wide range of his selections, has more profoundly read and digested trotting-horse literature. Although Occident, who made the champion record of 2:16¾, the only standard trotting produce of Doc, the son of St. Clair the pacer, was his first great trotting horse in which he took unbounded pride, yet Governor Stanford was not led away into pacing strains for the production of trotters, nor did he lose time and opportunities by cultivating the collateral trotting families, but he drew, at the very first inception of his breeding enterprise, from the Hambletonians as the source and his main dependence for trotting uniformity and perpetuity. His first stallion purchase was Mohawk Chief, not a descendant of that race of Black Hawks that came through Long Island Black Hawk from imported Grand Bashaw, nor from that other famous family of Black Hawks that trace through Hill's Black Hawk and Sherman Morgan to the original Justin Morgan, but the non-standard son of Hambletonian 10, out of Lady Perrine, by Toronto. No son or daughter of Mohawk Chief appears in the standard list, and the reason, upon investigation, is obvious. His harem consisted at first of a miscellaneous assortment of indifferent broodmares, the product of the earlier California breeders, who raised horses upon the haphazard system of expecting great results from insignificant sources. They were generally the crosses of pacers and itinerant Morgans upon the original stock of the Pacific slope. Yet Mohawk Chief had trotting potency. He produced Glencora, out of Lady Gilbert, of unknown breeding, and she to the embrace of Electioneer dropped Lot Slocum, record 2:17¼. When thoroughbred mares were selected, out of Planetia, by Planet, he produced Penelope, the dam of Pedlar, by Electioneer, two years old, record of 2:27¾, and out of trotting-bred mares he sired Irene, out of Laura Keene, by Hambletonian, who produced Ira, record 2:24½, and Stanford, 2:26½, by Piedmont, out of Nellie Walker, by Thorndale he sired Nettie Walker, the dam of My My, record 2:25¾, by Eros, while out of Sontag Nellie, by Toronto Sontag 307, he sired that great broodmare Sontag Mohawk, the dam of seven standard trotters by four different sires with records ranging from 2:17¾ to 2:29½. Thus before the death of Mohawk Chief, Governor Stanford had begun the system of selecting trotting and thoroughbred mares, which, in subsequent years, he has completely adopted to the exclusion of cold-blooded broodmares. His ultimatum was extreme speed with capacity for endurance. He realized that Palo Alto, no matter how munificent may be its endowment, would be comparatively

Digitized by Google

fruitless unless he thus laid broad and deep the foundations of his breeding stock. He made extensive selections in the eastern and southern sections of the country where the very choicest trotting and thoroughbred representatives could be purchased.

With these objects in view he selected General Benton. Thus early did Governor Stanford indicate his faith in strengthening the trotting potency by inbreeding, for General Benton was sired by Jim Scott, the son of Rich's Hambletonian, he by Spaulding's Abdallah, he by Abdallah, the sire of Rysdyks Hambletonian, and the dam of General Benton was Lady Benton, sired by Gray's Hambletonian, he by Bloomer's Hambletonian, by Andrus Hambletonian, by Judson's Hambletonian, by Bishop's Hambletonian, by Imp. Messenger. Through his second dam General Benton received a strong infusion of Imp. Diomed and of Bush Messenger through his third dam. Through Jim Scott's first dam he received another cross of Imp. Diomed, for she was by Stubtail, son of Moody's Blucher and from his second dam another Messenger cross, for Old Peg was by Greenbush Messenger, son of Mambrino, by Imp. Messenger. Thus General Benton was a stoutly inbred Messenger with the Imp. Diomed back crosses through both Partridge's and Moody's Blucher's.

But this is not all. Lady Benton, the dam of General Benton, is the dam of four successful sires. Namely, (a) General Benton, record 2:34½, the sire of seventeen standard performers with records from 2:17¾ to 2:30, and of eight daughters, the dams of fourteen standard performers with records from 2:08¼ to 2:30, and of four sons the sires of eight standard trotters; (b) Jefferson Prince, the sire of six trotters with records from 2:19¼ to 2:28, and two sons the sires of two standard trotters and two daughters the dams of Belmont Prince 2:17¼ and Marvin 2:22¾; (c) Major Benton the sire of two —*Governor Benton out of River Lilly, by General Benton*, and Dick, out of Topsey, by Ethan Allen; (d) and Sir Walter Scott, the sire of Daisy Queen, out of Kitty Scott, by his own sire Jim Scott, record 2:29¼. Lady Benton has thus proved herself a remarkable broodmare, yet despite her greatness, by a strange inadequacy of the standard, she is not eligible to rank among the great trotting broodmares, for she has neither the required record nor has any of her great sons. The other remarkable feature in the career of this great broodmare is that Jim Scott produced neither standard performers nor potent trotting sires out of any other dam. The selection of General Benton furnishes the key of Governor Stanford's choice of trotting sires throughout the subsequent history of Palo Alto. For instance all of his trotting sires with the exception of Nephew, were out of great producing dams. Thus Piedmont is out of Mag Ferguson the dam of Almont Eagle, record 2:22, by Almont, and Electioneer is out of the wonderful Green Mountain Maid, the dam of eight in the standard tables.

The history of successful sires at Palo Alto is thus the history of successful dams, and the same invaluable lesson, extending sometimes to the grandams, has been of immense profit to other breeders, notably the owners of Nutwood and Egbert, Dictator, Daniel Lambert, Charlie B., Bourbon Wilkes, Ben Franklin, Belmont, Aristos, American Clay, Ambassador, Altamont, Almont, Alcantara, Alcyone, Young Jim, Woodford Mambrino, Wedgewood, Wilton, William L., Guy Wilkes, Wilkes Boy, Warwick Boy, Wallkill Chief, Volunteer, Tom Rolfe, Thornedale, Director, Onward, Swigert, King Rene, Strathmore, Simmons, Rysdyk, Rumor, Robert McGregor, Princeps, Pocahontas Boy, Pilot Medium, Pancoast, Norwood, Mambrino Patchen, Louis Napoleon, Jay Gould, Jay Bird, Harold and many others. Indeed the records indicate that the safest guide to secure a powerfully prepotent sire is to select a son of one of the great producing broodmares by one of the most prepotent of sires; and the chances are much in favor of a more enlarged success, if both the dam and grandam, like Beautiful Bells and Bicara, have proven their greatness as producers.

Another notable feature in the methods of Palo Alto is the fact that all stock horses have been selected from a distance. Whether migration is practically a factor of success is questionable. Whether the

Digitized by Google

comparative failure of Mambrino Chief and George Wilkes in New York state, and their brilliant success in Kentucky is due in part to a change in location, or wholly to rest from severe training and to a much more richly bred harem, will be a debatable subject during the existence of turf literature. Other conditions being equal, namely: The same grade of broodmares, the same feeding, forcing and development of the produce, there seems to be no biological reason why the sire should become either more or less potent simply by a change of climate. Palo Alto, however, has steadily adhered to this practice of selecting its sires from a distance. Broodmares of all the other families in Kentucky have been purchased, but never has a son of Sultan or Guy Wilkes or Echo or of any of the other great California sires, been selected for service at Palo Alto. Whether this practice of selecting sires from a distance has been carried to its ultimate conclusion, now that the entire horses for service at Palo Alto are equal in performance and lineage to all others, either in New York state, Kentucky, or elsewhere, is exceedingly probable, for that immense establishment has now within its resources all the best combinations of blood and form and speed necessary for the rapid improvement of the American trotting horse.

The broodmares have been selected with as much critical scrutiny as the stock horses. Whether trotting or thoroughbred, individual excellence is the criterion always in view. This embraces size, form, blood and performance. This discrimination extends so far that even the sister of a great trotting performer, if she has no strongly marked points of excellence, is not retained for brood purposes. This rigid system of selection has borne golden fruition; for in addition to the champion stallion and the champion mare, and at one time the champion trotters of all ages, to the end of the year 1891, Palo Alto has produced 134 standard performers, and many more with records ranging from 2:31 to 2:35, whose tuition has not yet been completed.

All stallions capable of exercise are driven sufficiently to promote healthful vitality, which is never endangered by excessive stud duties, either in frequency or in the number of matrons. Never is more than one mare presented to him during twenty-four hours, and both the duration of the season, and the number of mares are restricted well within the capacity of the stallion. All excesses are carefully avoided, for the cardinal principle at Palo Alto is the development and conservation of vitality in all its breeding and training departments.

The broodmares are invariably selected upon demonstrate dmerit.

In the selection of broodmares without regard to lineage, the primal standard is producers either in the dam, or in her daughters. When purely trotting bred the fillies of sires who not only produced speed themselves, but who came from producing dams, marks the method of Palo Alto's selection.

Thus the first broodmare in the catalogue for 1891 is Abbie, by Almont, the sire of thirty-six dams of forty-three standard trotters, including J. B. Richardson, 2:16¾, and Alabaster, 2:15. The dam of Abbie is the famous Norma, 2:33½, dam of Norval, 2:14¾ and Lucy Cuyler, trial 2:15½, by Alexanders Norman, sire of Lula, 2:15, and the sire of twelve dams of sixteen standard trotters.

Thus rich in dam as well as sire producing capacity, Abbie's fillies are preserved for brood purposes Her daughter Abbess, sired by Mohawk Chief, when mated with Woolsey, full brother to Sunol, produced Abeto, who has scored a record of 2:28½; so that Norma's produce in the female line are preserved as exceedingly valuable broodmares. The same method of selection is manifest throughout the catalogue. The very next list of broodmares after the Norma produce begins with the famous Addie, dam of Woodnut, 2:16½ and Manon, 2:21, sired by Hambletonian Chief, son of Hambletonian 10, dam, Monton by that renowned sire of broodmares, Sayre's Henry Clay. All of her fillies, with the single exception of Marion, have been retained as broodmares. The wisdom of this course is manifest, when it is noted that one of her daughters, Manette is the dam of the champion two-year-old trotter Arion, 2:10¾, and another, Maple,

Digitized by Google

is the dam of Hattie D, 2:26¾, while the third, Addie W., sired by Whips, has as yet only two foals, the older one being the produce of the year 1890.

If the mare is a great producer, even though the pedigree is not ultra-fashionable, provided the blood is stout, she and her fillies are retained as broodmares. Thus Alvaretta was sired by George Lancaster, who has no mention either in the list of standard performers himself or as the sire of them, and who has not even a place in the table of sires of dams of two or more standard trotters. The dam of Alvaretta was Melinche, by St. Clair, the pacer. Yet she was selected because she was out of the dam of Fred Crocker, 2:25¼, the champion two-year-old of his day. The wisdom of the selection is shown in her proving to be the dam of both Aleck B., 2:28¼, and Alma, 2:28½, by Electioneer. Another daughter of Melinche, by George Lancaster, named Pearl, was also retained, and she, too, demonstrated the sagacity of this producing principle of selection, for she is the dam of Pomona, record 2:28¼, by Electioneer.

The principle of inbreeding to the most incestuous degree in some of the broodmares is not ignored at Palo Alto. Alvinza, the daughter of Whipple's Hambletonian, dam also by Whipple's Hambletonian, is a striking illustration of this fact. But there was a profound reason for this inbred selection. Whipple's Hambletonian was not only a trotter, showing, without training, a record in 2:39½, and siring eleven dams of fifteen standard trotters, but three of his daughters, namely: Countess, dam of Strathway, 2:20, and Dawn, 2:18¾; Lady Babcock, dam of Elector, 2:21¾, and Soudan, 2:27½; and March Fourth, dam of Kildrain, 2:22¾, Paladin, 2:29½, and Thornwood, 2:27½, are in the great broodmare list. The daughters of the greatest producers of trotters and of the dams of trotters are largely represented in the paddocks of Palo Alto. Thus America, the dam of Benton, record 2:20¾, and Bonnie, 2:25, was sired by the great Rysdyk's Hambletonian, sire of the dams of Stamboul, 2:11, and Trinket, 2:14, and Greenlander, 2:15, and of fifty-six others, the dams of seventy-three standard performers, and so are Gazelle, record 2:21, and America. All the more successful sons of Hambletonian, such as Volunteer and George Wilkes and Electioneer and Messenger Duroc and Dictator and Arthurton, and his most successful grandsons, such as Almont and Belmont, General Benton and Whipple's Hambletonian; all the great producers from the loins of Mambrino Chief, such as Peck's Idol, Kentucky Prince, Mambrino Patchen; all the collateral families of trotters, such as Governor Sprague and Alexander's Norman, as well as the great family of broodmare producers, the Pilots and the Clays and the Patchens, are represented by choice daughters at Palo Alto that have vindicated their selection by their success as the dams of standard performers.

The thoroughbred mares are from the stoutest of winning strains. Lexington and Imp. Australian and Belmont and Imp. Knight of St. George and A. W. Richmond and Imp. Bonnie Scotland, Imp. Buckden, Imp. Glencoe, Imp. Hercules, and indeed all the thoroughbred sires that have begotten long-distance race horses, have all contributed to the broodmares of Palo Alto, when any of their daughters have been found with the requisite qualifications of size, formation and trotting action.

When all these sources of speed in the combination of producing broodmares, comprehending blood, performance, individual excellence of size, color, formation and vitality are considered, the reader is amazed that this mighty collection is the broad-minded selection of a single breeder. It indicates the absence of belittling horse prejudices that frequently dwarf the selections of many breeders. It argues a magnificent success in both the immediate and ultimate production of the trotting horse of extreme speed that has not only startled the breeding public in the past but will give it still greater material for wonderment in the future. No other breeder of the trotting horse, indeed no number of such breeders have massed such a liberal collection of all the varied elements that have demonstrated their capacity to contribute to

Digitized by Google

the speed and gameness of the American trotting horse in the course of his scientific development toward the perfection of the breed. Not a single approved element has been omitted. Theories and prejudices which beset all new enterprises to their detriment have been discarded. The results have been as marvelous as the plans of the originator of this enterprise have been unique. All the older trotting-stock farms are drawing upon this single establishment for materials to enrich and improve their harems. All the champion records were held at one time by this juvenile Palo Alto.

In other countries the government established the breeding farms which not only take the lead but actually stamp the type of the families of horses whose pure breeding conduce to the wealth and necessities of the community. In free, abundant America, no such governmental aid and authority is exercised. If such control had been exercised there would have been very few of the methods of Palo Alto in vogue. No commission appointed by the department of agriculture would have countenanced the use of thoroughbred mares, for the ample reason that no such a commission could have been selected from the body politic of trotting-horse breeders at the inception of this enterprise, who would not, in the language of the trotting registrar, pronounce it "running foolishness." That condemnation, Governor Stanford, by his successful breeding, has materially modified. In fact, it has been reduced to a mild protest, associated with the inconsistent affirmation that the dead Electioneer carried to the grave with him for all time that intensity of trotting prepotency which could overcome the running action and disposition of the trotting sire's produce out of thoroughbred mares. The proprietor of Palo Alto only asks a reasonable time to dislodge this assumption. Azmoor and Whips have already demonstrated their capacity to produce trotters out of thoroughbred mares, even though they are themselves half bred, while Ansel and Anteo, and Antevolo are breeding on with the most brilliant promise. The demonstration seems to be as swift in operation as it is absolute in character. This year will be presented the two-year old quota of the champion half bred horse, Palo Alto, while Lottery, out of Texana, by Foreigner, son of Imp. Glencoe, Hugo, 2:27½, out of Helpmate, by Planet, and others similarly bred, have produced foals that give evidence of remarkable trotting capacity.

It may, therefore, prove an incalculable benefit to the American breed of trotting horses that neither the breeders at large, nor the government, have so far dominated the principles of the trotting-horse production as to prevent the experiments of Governor Stanford. Furthermore it seems to be an equally valuable good fortune that his comprehensive plans and intelligent selections have been made possible by the limitless expanse of his personal wealth.

To the wisdom of his selections and the generosity of his purchases we may justly add the favorable location of his breeding farms in the land of the setting sun, where the climate is as mild as if it was always a summer afternoon. When to these are superadded the princely endowment by which Palo Alto is to continue a permanent trotting stock farm, the future of the perfected American trotting horse seems to be secured beyond a peradventure.

CARE OF THE BROODMARES.

The broodmares are invariably housed every night during even the mild California winters. Each one being provided with a capacious box stall, enclosed in an ample paddock. During the day time, in fair weather, they roam at pleasure.

They are generously nourished. Ground oats and corn, with hay, carrots, and a liberal supply of salt, keep them strong and in good condition, but the accumulation of excessive fat, to the detriment of their maternal success, is carefully avoided.

The broodmares of Palo Alto are bred as soon after February 10, in each and every year, as they present themselves, and when safely bearing the burden of maternity, they are turned into the pastures as soon as the settled spring season begins. There they remain under daily inspection of competent overseers

Digitized by Google

until the late fall rains, or the scant pasturage demands their housing and feeding. Some days before foaling the brood mare is confined in a large box stall, and fed chopped feed and hay. When the colt is safely delivered her diet is changed to cooked food consisting of ground oats and barley, and wheat hay. As soon as the spring grass grows she is turned with the foal into the early pasture. But every night she is confined in her roomy box with the colt. This method of feeding ground food and grass, and housing at night, is continued till the colt reaches the age of five months. Then it is weaned, the dam's milk carefully dried until the flow entirely ceases, when she is returned to the pasture, there to remain until the inclement autumn again consigns her to winter quarters.

Perfect health, the result of good condition, which means neither stall-fed adipose nor the weakness of leanness resulting from insufficient nourishment, is the rule at Palo Alto. Every symptom of discomfort is carefully noted, and, as far as possible, instantly checked. Even the teeth and feet are scientifically treated, the former to promote healthful digestion, and the latter to stimulate abundant exercise with the least foot weariness. These strong, sound broodmares, thus conditioned, produce healthy, vigorous colts. In the broodmare department the cardinal motto is "Healthy mares, kept in the bloom of vitality, alone produce model foals."

Before the colt is separated from his dam he is safely haltered, and led into a box with a five-months-old companion. They are thus invariably weaned in pairs. This humane treatment avoids much of the distress which the lonesome colt suffers when taken away from its dam, and the loss of its constantly attentive mother is soon forgotten. His first lesson is that of thorough subjugation to the halter. Nothing can be more quickly or simply accomplished if the method of Palo Alto becomes universal. A strong surcingle is buckled around his girth. In the ring of the halter, on one side, is snapped a long strap, which passes through a ring fastened, on the same side, to the surcingle, around the hips to a corresponding ring on the other side of the surcingle, to the ring of the halter. The halter shank and the end of the strap passing around the colt are then taken in hand. The colt is commanded to walk by tightening the halter shank. As a rule he refuses to start. The strap around the hips is then gently pulled, and he will either walk or jump forward. After this operation has been repeated several times, the colt will lead anywhere by the halter. The entire breaking does not last longer than five minutes. After this initial lesson is completed he is taken to the colt-training stables. For two months he is walked and fed and exercised and groomed until he is in condition to begin work in earnest in the kindergarten, which has made the success of Palo Alto in colt development absolutely phenomenal. The kindergarten is an oval trotting track, completely covered throughout its entire length of 315 feet in circumference and 65 feet in width from the inside rail to the outside of the enclosure. The stretches are long and level. The turns are thrown up one inch to the foot, after the method of sharp curves in railroad engineering. The posts incline from the top outwardly toward the ground. This construction prevents the colt, while leaning toward the pole, from striking his limbs and feet. To further prevent accident the inside rail is made smooth, well rounded, and strong, so that no accidental brushing against it can result in a serious injury. The track is harrowed every day to a depth of two inches. When an unusual number of colts take their exercise upon the kindergarten the course is harrowed three times every day. The colts, in their exercise, will naturally attempt to follow a beaten path. This soon becomes packed hard and solid. Unless the harrow frequently pulverizes the course, therefore, to the depth of at least two inches, the feet of the colts become sore, and the jar is liable to produce still more serious blemishes in the joints and limbs.

The primary lesson taught the colt in the kindergarten is confidence—trust in himself and faith in his trainers. Fear of being hurt and wantonness in his own sudden freedom are the two great dangers of his first introduction to the miniature course. These are carefully obvi-

Digitized by Google

ated by first leading the colt by the halter around the track, and by word and touch assuring him till he becomes thoroughly reconciled to all the surroundings, even if the daily repetition requires a week of careful instruction. When he ceases to start at anything—either fences, enclosure, men at the turns, or the snapping of their whip lashes—he is first led around the course for several circuits and then cautiously and gently given his freedom. At first the colt naturally breaks into a gallop. Sometimes it is wild and unrestrained, but, as in the field, this quickly gives place to the trot, with the head and tail aloft, frequently accompanied by snorts that indicate the joy of even his new-found yet restricted liberty. Two trainers, armed with four horsewhips provided with long lashes and keenly singing snappers, stand sentinel at each turn. They soon teach him the rules of propriety. When the preliminary run and trot are over he is furnished with a bitting rigging, and the check is fastened to about the height which he has shown is the natural carriage of his head. Protecting boots prevent all the forms of ankle, tendon, knee and speedy interference, but no shoes arm the feet. The very fact that the colt, thus unshod, is liable to interference, proves, beyond a peradventure, the necessity of dressing the feet level and of arming them with such weight in the shoes as will correctly balance the action when he is in training and driven up to his full speed.

The colt soon learns that the movement required is the trot. In that action he is encouraged by words of approbation. Every other movement is severely discountenanced. The reports of the whiplash both urge him to greater speed upon the trot, and warn him not to indulge in the gallop. If he runs persistently and willfully, the trainer walks from the center of the turn to the pole, where the colt invariably takes his exercise, and brings him to an absolute standstill. He is then slowly started again. If he is still rebellious, the discipline is repeated until the colt trots as obediently as if he was under the subjugation of a driver and the restraints of harness. One of the surprises of the kindergarten is the intelligence of the average full or half trotting-bred colt. He rapidly learns the object of this systematic training, and soon becomes as apt as the well-trained circus palfrey. When he has acquired the idea that the trotting movement alone is what is required, he not only adheres to it steadily, but courageously forges ahead to develop speed at that gait. He readily acquires the curriculum of trotting around the track one way three or four times, and then, at a signal, such as the upraised whiphandle, to come to a stop, turn, and speed the reverse way of the course. Thus the intelligence of the colt, the brain as well as the limbs and feet, receive in the kindergarten those lessons of development and subjection to control that not only makes him more easy to educate, when he is promoted to harness instruction, but enables him to obey more instantly and perfectly the behests of the master reinsman in the crisis of a closely contested race. The cardinal principle of training at Palo Alto that extends from the weanling tuition through the kindergarten on to the race course is always to stop in the daily exercise before the vitality is exhausted in the least degree. The apothegm might be displayed everywhere over the domains—"exhausted vitality ends further improvement." No colt is worked in the kindergarten, therefore, till he shows weariness; for either mental or physical staleness means discouragement; and the discouraged colt will go backward in his training both more rapidly and permanently than even the aged trotting horse. If a colt shows no desire to trot on a certain day, and his disinclination is not the result of perversity, he is instantly taken out and permitted to range in a paddock. If he is willing to trot, but moves with the slightest evidence of discomfort, resulting from either tenderness of foot or muscle soreness, or tired brain, he is not worked again till he is palpably free from pain. The entire discipline is stripped as far as possible of all resemblance to force. The intention is to elevate the exercise into the feeling of recreation. To accomplish this not only the mechanical conditions of the course must be perfect, but the trainers must be carefully trained, being blessed with patience, gen-

Digitized by Google

tleness, yet firmness, and a never-sleeping, never-failing exhibition of the most excellent judgment. Possibly the judgment of the master trainer in the kindergarten is even more disciplined than the reinsman on the race course. He must not only thoroughly understand the routine work, but must be horseman enough to discriminate between the vitality and stamina of the various constitutions. He must add to this scientific, almost intuitive knowledge, the capacity to distinguish between rates of speed, and when a colt has gone far enough to arrest his work in the full display of his ambition and capacity. If the colt is full of courage, and after a splended burst of speed breaks into a headlong gallop, he should be permitted to extend himself till his center of gravity is well under control, when by a gentle admonition, such as the soothing tones of the voice, or a report from the whip, not cracked, however, in his face, or with the energy that means increased speed, he will again resume the trot and speed faster than when he plunged forward into the break. If the over-officious trainer endeavors to check him too soon, and the colt suddenly plants his heels into the ground and stops and whirls and speeds away either on the run or the trot, then the kindergarten is the prolific source of evil. For the sudden turning produces the intense strains that bring on curbs and splints and spavins, and weakness over the loins, and both temporary and permanent decrepitude. All these troubles are sought to be avoided at Palo Alto by the selection of rarely gifted miniature colt trainers. They have acquired wonderful proficiency. When they say "Whoa!" the colts slow up. When this command is changed to the next routine injunctions, "Stop!" "Turn!" "Go the reverse way of the track!" they give prompt obedience. When his hands are elevated and the trainer shouts, "All right!" they as quickly stop, turn around, and walk as leisurely to the gate opening toward their stable as if they had received their training from the most exacting master of the manage. The use of the long whips is in accordance with the scientific method adopted by all expert trainers of horses for specific display purposes. The French and English and German as well as the American manage trainers teach their horse pupils to walk, back, lie down, and perform all the evolutions of the ring by means of the long whiplash as an accompaniment to the voice, and this kindergarten method is but the adoption of this approved practice. The reports of the whiplash have a myriad language to the colts. They urge them to increase their speed; they act as a corrective when they break; they bring them to a standstill when given in connection with the command; and they lose all the terrors which fear inspires, while they never lose their power as incentives to almost instant obedience. The best possible argument that can be presented in favor of the kindergarten is the rapid rate of speed acquired by weanlings before they become yearlings. Some of them acquire a gait that if it could be maintained would carry them a mile in two minutes and forty seconds. Moreover, it inflicts upon the growing weanling no greater weight or incumbrance than the ounces compressed into the protecting boots. He does not even carry the weight of harness or shoes. Moreover, the stretches are so short that the fast work has its relief at every turn, where the weanling learns to slacken his speed. The greatest danger lies in giving him an amount of work in excess of his vitality and condition. Only the most judicious trainer can carefully guard against the overtaxing of his strength. This exercise must undoubtedly increase his lung capacity and rapidly develop his muscles of locomotion. The surprising increase in his growth and strength is the demonstration of these results.

It is certainly a preferable method over the colt-leading system so extensively practiced in Kentucky; for the colt thus led along side of a running horse is frequently forced beyond both his speed and constitutional capacity. When he breaks from being forced too fast, or from exhaustion, the sharp check upon the single bridle rein, by which he is led is apt to prove more injurious than the excessive rating from which he plunges forward into the gallop.

The kindergarten, of all the means adopted by modern ingenuity to abnor-

Google

mally develop the immature colt is the most humane, but to conclude that "it is absolutely unattended with injurious results, would not be the consensus of concurrent testimony. The extensive establishment of Mr. William Corbitt, at San Mateo, Cal., is provided with a kindergarten track that is never used, simply because, in the judgment of its proprietor, and of his exceedingly astute trainer Mr. John Goldsmith, it has a direct tendency to make the colt's muscle sore, frequently terminating in permanent strains over the lions. If this be the fact then the victims of early maturity will begin in their weanling instead of their yearling and two-year-old forms, and the statistics of early decrepitude if candidly published would show an alarming increase. The *rationale* of the colt kindergarten commends itself only upon its extremely judicious use. If the work can be given according to age—it may be more emphatic to add, according to the days and weeks and months of the weanling's age—then it is like teaching a child from infancy the gradual, almost imperceptible steps of his education from the alphabet to mental philosophy or from the numerals to differential calculus. Then it rationally develops the brain as well as it healthfully develops the muscles. The brain education is the more complete when the colt learns to trot fast on the miniature track, because he is then comparatively self-dependent, as he has neither weight nor rein to steady him, nothing but his own resources, and the stimulus of the swirl and crack of the lash that never touches him. Within these proper limits it must develop, without injury, both the lung capacity, and the muscles of locomotion, as is clearly evidenced by the ease and comparative freedom from panting and exhaustion which the weanling after his exercise displays. This physical and mental development is continued on the kindergarten course regularly after his training in his yearling form to harness has begun in earnest. Then the weanling lessons demonstrate their great advantage to the colt, for he is invariably more steady on his gait, more in earnest in his speed efforts, and more rapid in his improvement than when he has never had this preliminary instruction. In refutation of this position, it is truthfully claimed that Arion was never subjected to the kindergarten; nor, it may be added, were the other two great two-year-olds, Monbars and Ralph Wilkes. But these citations simply prove that great trotting colts can be developed without the instrumentality of the minature course. Where one is thus developed by other means, many more are successfully instructed on the colt track. With the single exception of Arion, all the great champion performers of Palo Alto were thus taught their first trotting lessons in the kindergarden, including Sunol, Palo Alto, Advertiser, Electricity, Bell Bird and a long list of others that might be cited. But this is not all. Every one of these great trotters were distinguished performers on the baby course, without a single exception. To this means of selecting the colts thus gifted with speed may be largely attributed the success of Palo Alto with young trotters, for she has developed more than any other stock farm whose endeavors have been to educate winners of the rich colt stakes, that make an important era in the great trotting races of the present day. Then it is a source of advanced education for both trainer and colt, for it enables the reinsman who has learned that balancing the trotter has advanced to the dignity of a mechanical fine art, to note the natural carriage of the colt and his action either in jogging or in speeding. If he has cultivated an intelligent mechanical insight he can profit by these observations, and determine what corrective appliances, if any, are necessary to promote a more perfect trotting movement.

The great objection, it must be reiterated, to the kindergarten is the danger of overexerting the exceedingly immature weanling. Curbs and spavins and inflamed tendons and injuriously taxed muscles and overheated system and wearied ambition are as easily produced as would befall a child of tender years before his baby teeth have been displaced by the stronger ones of boyhood, whose organization is being developed for the leaps of an acrobat, or the desperate feats of a gymnast. The whole value of the kindergarten depends upon

Digitized by Google

the most consummate skill and thoughtful consideration of its presiding genius. It is easy to crack the long, loud snapping whip lash. Any mountain stage driver of the Sierras is an expert in this accomplishment. Then it is delightful to watch the colt, with head and flag high in the air, trot rapidly over the stretches, in obedience to these loud reports, as if he was gifted with wings. But it is much more difficult to gauge the constitutional vitality of each colt as he appears for his training upon the kindergarten; to determine just how much work each one should have, and to judge when the speed is within the capacity of the colt, and when it is doing him any of the legion injuries of overtaxation.

Mr. Marvin, in his volume on training the trotting horse, confirms this resume by the following words of wisdom:

"To do the greatest good, with the "least jarring friction and trouble, you "want skill (on the kindergarten) as "great as the man that sits in the "sulky. To know how far to go with-"out going too far is the great point."

The condition of the majority of the colts that come up from the miniature track to the race course would alone determine whether this requisite skill is exercised by the postillions on the turns. Teachers should be specially trained to impart this exceedingly delicate tuition, for, judging by the puffed joints and enlarged limbs of the average yearling and two-year-old trotters, in defiance to the most careful and scientific handling, and despite the appliances of liniments and compress bandages, to keep the limbs and feet of the weanling colt free from enlargements by just enough work for development and not injury, is as dainty a task as to improve the perfume of the nasturtium, or to retouch the delicate tinting of some rare orchid.

If Mr. Goldsmith is correct in his statement that not one out of twenty yearlings trained for great performances remain sound to the maturity of horsehood, then the more tender weanlings must suffer still more frequently in proportion. Unless the care and discretion we have indicated is constantly applied, it must eventuate in simply the survival of the fittest. At Palo Alto every means is used to keep the colt in the kindergarten strong and healthy, so that he can take this work with the least possible resultant injury. He has a well-ventilated stall, provided with ample bedding. He is given a generous allowance of nutritious food four times a day, consisting of ground oats, hay and water. To these is added a judicious supply of lime water, not only to tone the stomach and to prevent both acidity and indigestion, but as a powerful means of contributing to the quantity and quality of the bone structure.

If nourishment and intelligent treatment can thus eliminate injury from the kindergarten, all possible precautions have been taken by the originator of this method of baby training to conserve this end. Still the charge is often repeated, without the proof of statistics, that the kindergarten is the scene of the wholesale slaughter of the innocents. Like most of the dogmatic assertions of horsemen, this statement has never received the authentic confirmation or denial which the records alone can furnish.

In order to put a quietus upon the extravagance of either its affirmation or denial the author has received authentic data from the books of Palo Alto that deserve historical publication.

Governor Stanford has uttered the seeming paradox that it is the "let up," not the work, that brings on the injuries of early training. This apparent contradiction is explained by the statement that the long rest so weakens or softens or enervates the organism that infirmities occur after this season of lassitude, when the colt is again taken up for work, rather than when he is seasoned by the tense condition of daily training. As a physiological conclusion there is much more wisdom in this observation than the general reader would conclude. The time for the injuries sustained by weanlings from the kindergarten practice, therefore, would appear in their yearling form, yet the records show that only two yearlings ever broke down at Palo Alto that were trained to trot for yearling records, and one of these had been injured before being trained. The first effort to develop a yearling trotter at Palo Alto was an absolute failure.

Digitized by Google

The management knew no more about the delicate colt structure than the early Kentucky horsemen who trotted gifted colts like Alley West in their two-year-old forms in the mud, in three in five-mile heat contests, with front shoes and toe weights weighing two pounds on each front foot. When the system of colt training was studied as a science then the failures became greatly reduced. The training of yearlings was begun at Palo Alto in 1880. In the early spring of the year Benefit, a bay colt by General Benton, dam Lucetta by Rysdyk's Hambletonian, was the phenomenal yearling trotter of the farm. He was placed in no less judicious hands than those of Mr. Charles Marvin. It was the intention to trot him against 2:56¼, then the champion yearling record. He could have easily beaten that record. He trotted a quarter in thirty-seven seconds, and bade fair to startle the trotting-horse community. But early in the year, without any ostensible cause, he broke down. His tendons filled. Even after rest had reduced the inflammation, and his step was sound in the pasture, the lameness returned again and again when he was put into training. Finally all further attempts to train him were abandoned, and the colt was turned out as a hopeless cripple.

In 1881 the attempt to train yearlings was again repeated. Three promising ones were selected. They were:

1. Arol, by Electioneer; dam Aurora, 2:27, by John Nelson, son of Imp. Trustee.

2. Alfred, by General Benton; dam Alice, by Almont, out of Norma, 2:33½, by Alexander's Norman.

3. Hinda Rose, by Electioneer; dam Beautiful Bells, 2:29½, by The Moor, were the yearlings selected to train for champion records.

The brown filly Arol trotted a quarter in forty-one seconds, but she was so far outclassed by the peerless Hinda Rose, who made the yearling record of 2:36½, and the two-year-old record of 2:32, lowered in her three-year-old form to 2:19½, that she made no public exhibition as a yearling. But her retirement was in no wise attributable to decrepitude, for she trained on, and scored a record of 2:24¼, in her nine-year-old form. She was then sold to go to the eastern states, and died in transportation. Her speed was just becoming remarkable, and she was regarded as one of the most promising ever bred at Palo Alto.

Alfred was full of speed, but he was more full of length and height, for as a yearling he gave evidence of his present height of sixteen and three-quarter hands. He was sixteen hands high when twelve months old. His age is now twelve years, and again he is in training. During the first week in July, 1892, he trotted a mile in 2:36½, and repeated in 2:34 the last half mile in 1:14, and the finishing quarter in thirty-five seconds. He will certainly make another credit to General Benton's standard list before the season closes.

In 1882 there were two yearlings trained; the one, Alta Belle, by Electioneer, out of the famous Beautiful Bells, and the other Wyandotte, by General Benton, out of Winona, by Almont, second dam Dolly (dam of Director, 2:17; Czarina, 2:21; Thorndale, 2:22¼, and Onward, 2:25¼), by Mambrino Chief.

Alto Belle was accidentally injured before she was broken to harness. From this misfortune she never fully recovered. After slight training she hopelessly broke down, and she has since been sold for brood purposes.

Wyandotte was full of early speed. But he was a nervous, washy colt, so that he did not start, and at last found his way, as a gelding, to the road horse stables where he is now a fixture. Still he trained on, for he trotted a half mile in 1:09, and has to-day both soundness and great speed.

In 1883 St. Bel, by Electioneer, dam Beautiful Bells, was trained as a yearling. He became lame in one of his front ankles and had to be turned out. After a long rest he recovered, and secured a record of 2:24¼, and proved himself to be a sound game horse.

His full brother Chimes was the most promising candidate for yearling honors in 1884. But he was not speedy enough, and was not started. He scored a record of 2:33½ as a two-year-old, and was then sold. The next year he reduced

Digitized by Google

his record to 2:30¾, and had speed enough to have easily entered the standard list. Then the practice of training yearlings was discontinued at Palo Alto, simply because the management were satisfied to rest upon the unequaled yearling performance of Hinda Rose.

From 1884 to 1887 no yearlings were trained. But when Sudie D. wrested from Hinda Rose the yearling honors by beating her record three-quarters of a second, Mr. Marvin became aroused, and selected Norlaine to regain the championship. She succeeded by winning a record of 2:31½, but whether the training injured her can never be known, for she was destroyed by the conflagration of the stables in which she was confined.

When the yearling record was thus regained there were no yearlings trained for the succeeding years of 1888–89–90. When Freedom, the splendid yearling son of Sable Wilkes, eclipsed the record of Norlaine by trotting a record mile in 2:29¾ in 1891, both Bell Bird and Rowena, the first purely trotting bred, and the latter three-quarter thoroughbred, were selected to regain the yearling trotting honors for Palo Alto. Rowena met with an accident, not a break down, which threw her out of training, while Bell Bird, her equal, but not her superior in speed up to the date of the accident, trained on to a record of 2:26¼.

Both are now sound and taking their training with great resolution and promise. Rowena only secured a yearling record of 2:37, but she is showing as much speed as Bell Bird, and that will be sufficient to distinguish her as one of the great two-year-old trotters of the year 1892. Thus Palo Alto has trained only eleven yearlings for records in the same number of years. The impression has been abroad that it is the general rule, not the exception, to train yearlings for records on this great stock farm, and that the break down of yearlings, resulting from over work, primarily in the kindergarten, which if not then completed is finished in their yearling forms on the mile training track, number by the hundreds instead of a single dual of instances. Yet the records prove that only two out of eleven yearlings have suffered from training, and one of these had previously received a serious injury.

All yearlings at Palo Alto are broken to harness, but this process of gentling and gaiting the colts does not extend to such earnest training as may be necessary to beat the yearling record. The number of yearlings is so great that it would be practically impossible to give them all this thorough handling. The kindergarten determines the choice. The weanlings that have shown the most exceptional speed on the miniature course are the ones selected for great performances in their yearling forms, and they have never failed to fulfill in harness the promise they showed as weanlings. Thus seven out of the eleven have reduced the remarkable records they made as yearlings. While one broke down, one was injured before being trained, and two, while not injured have never, as yet, made their appearance in public.

This authentic *resume* completely disproves the reckless statement which appears many times in every season that the kindergarten is a slaughter pen of weanlings, and that the fields of Palo Alto are swarming with infirm colts, the victims of the miniature course discipline. This is the usual opposition to a new system. Veteran trainers have stereotyped methods of training that includes an abundance of jogging and progressive slow miles. These methods are at war with the short, sharp, brush system of Governor Stanford. His initial idea is the development of speed, by rapid brushes, not the development of stamina by the long, tedious routine of many repeat miles, well within the speed capacity of the horse under training. If the trainer's system of preparing campaigners had been adopted at Palo Alto, instead of the kindergarten and the speed brushes, the probabilities would be decidedly in favor of breaking down of ten, instead of one out of the eleven yearlings trained at Palo Alto for great records. Very few trainers can reserve the colt's speed for the last quarter, as the considerate Doble does that of Axle and Tony V. They rarely realize that better results can be attained in the way of speed, with less liability of injury by brushes at shorter distances, than by the arduous strains of

Digitized by Google

miles of jogging and repeating. The statistics of Palo Alto conclusively show that more colts are injured by running at large in the fields of Palo Alto, notwithstanding the precautions for their safety, than are injured in the kindergarten.

The conclusion seems to be irresistible that if the insatiable demands of the trotting community for colt performers, as evidenced by the extravagant inducement offered in the ever-increasing colt stakes, are to be responded to by trotting-horse breeders, the more humane methods of the kindergarten and short brushes are to be preferred to any other system of colt development. If its results on the large scale in which it will be tested prove to be detrimental to the trotting-horse interests, no establishment will more emphatically demonstrate it than Palo Alto.

PROBLEMS IN BREEDING.

BY A. H.

Heredity.

I.—Fact.

Heredity, as generally understood, implies the contribution of two sex elements —male and female. These are considered to offer certain constituents, however different they may be supposed to be, bearing certain hereditary influences.

Formerly, heredity was considered simply from apparent evidences, or "symptoms" without any attempted reference to the actual, ultimate constituents or elements causing them. Such works as Darwin's (son) "Breeds and Breeding" (*Encyclo. Brit.*), and Miles' "Stock-breeding," mark the period of determinations of the past. "Since then" the subject has been taken up by biologists in connection with its special bearings on "the fact" of evolution itself.

Vast discoveries have been announced, and marvelous results attained by the scientific method. While the system used by the old lights resulted in a store of "facts," that of the new endeavors to trace the origin and explain "the why" of these. With such object in view it has appropriated as its proper starting point and foundation groundwork the elemental phenomena exhibited in the contributive formation of the animal egg essential to bringing into existence a new individual "like" its parents. These elements and these phenomena exhibit the behavior of the reproductive contributions in their simplest and ultimate known constitution. In fine the student of heredity's "elements" with which he has to grapple are the *ova* and the *spermatozoa* comprehensively, or the *ovum* and *spermatozoon* individually. To thoroughly master the phenomena presented to us by these, individually and conjunctively, structurally and functionally, is the first requirement of the modern student or critic of the phenomena of heredity.

As these "elements" very apparently result in complete adult individuals they evidently deserve watching. The future history of heredity will center round the results obtained by the study of the germ cells—male and female, ova and spermatozoa.

The physical basis of life and structure has been reduced to the simple aggregation of specialized single cells consisting originally of simple protoplasm—pure formative material. It is also a fact that the single original ovum and sperm are simple cells of this same protoplasm. Thus it would appear that we have an easy task before us. If that does not so appear to the reader we must have him to keep still ever in view the actual simplicity that the *ultimate* "elements" must certainly possess.

As the basis, then, for the understanding and intelligent consideration of the titled problem, we must expell, meantime, all other ideas from our minds but the mastery alone, and first of all, of "the materal basis of heredity." (Minot uses the word *physical* instead of "material").

As in our previous article on "Sex" our present object is to put before the intelligent breeder what science has been

Digitized by Google

doing for him. We have approached this subject from his own standpoint—as anxious to study and learn what science can teach. We have endeavored to present, in an orderly fashion and in a manner that the reader will have as little difficulty in following as our "intelligence" has known how, the elements, rudiments or foundation of the whole subject. Let those who would desire to intelligently take advantage and intellectually secure the enjoyment of modern discussions on heredity—let them master the matters herein detailed.

The new views—as expounded by Professor Weismann, of Freiburg, whose brilliant discoveries have led him to the formulation of nothing less than revolutionary theories—render the re-examination of the whole groundwork necessary. From these first steps we shall endeavor to lead the reader through the very thickest and most intricate paths that are being hewed out anew. These first steps involve the study of the subject, primarily in the manner we have herein grappled with, which is the kindly light that leads us on.

For the material of the chain we have endeavored to link in such a fashion as to be easily mentally handled, we have consulted the leading authorities themselves, as we indicate throughout.

THE MATERIAL BASIS OF HEREDITY.

The Female Element or Ovum.—The ovum presents all the characteristic features and structure of an ordinary animal cell. Such structure consist of (*a*) the cell wall or enclosing capsule, (*b*) the cytoplasm or protoplasm outside, or surrounding (*c*) the nucleus or "germinal vesicle."

The cytoplasm, or extra-nuclear cell substance, exhibits, under high magnifying powers, a homogeneous appearance, or matrix "traversed by a delicate network, with minute yolk-balls, pigment, and other granules strewn about the meshes" (Geddes). Out of this is obtained an abundance of reserve nutriment, besides giving origin to the development of the special architectural features that apparently have an altogether marvelous transforming, rearranging power or function in relation to the future duplication of the nucleus, which will come under particular review.

The composing structure of the nucleus has also been made known to us, whereas to the old observers it was nothing more than a mere vesicle, it is now a very apparent (to the aided eye) "intricate microcosm; it has, in reality, a most complex structure and a curious internal life all its own."

"The nucleus, situated approximately in the middle of the ovum-cell, when quiescent, often lies in a little nest or chamber within the cell substance, and is limited from the latter by a more or less distinct nuclear membrane, which disappears as the period of activity begins. Inside this membrane it is often possible to discover one or more nucleoli (or germinal 'spots') lying in a more or less fluid material, often called the 'nuclear sap'. As to these nucleoli and bodies more or less like them, about the reasons for their variable number and form very little that is certain can be told. Much more important is the essential constituent of the nucleus, a system of strands, coils, or loops, which as they stain deeply with various dyes are therefore known, to distinguish them, as the *chromatin* elements. In contrast thereto the less stainable, and to some less apparently essential constituents of the nucleus are distinguished as '*achromatin*'—*i. e.*, not stainable."

We had better at once here emphasize the introduction of the reader to the chromatin elements, by informing him that it is this chromatin, (*in the male and female nuclei*), that is now regarded as the real *material basis of heredity*. Let the reader carry this idea, as a thread, along with him.

The chromatin elements in the inactive or quiescent nucleus oftenest appear to be disposed in a manifold or tangled coil, "like a disordered ball of twine," while in other cases "rather as a living network." Though their appearance suggests disorder, that is not their real disposition. The coils, we may be assured, are in no disorder, but preserve a perfect definiteness throughout. Some describe them as continuous, others as interrupted. Both may be right. This is, however, "subsidiary to the more

Digitized by Google

iking fact," that in the state of activ- the number and disposition of the ickened or loosened parts of the coil main definite and orderly, and that eir behavior is like that of minute in- pendent individuals, so that any view "a rough-and-ready mechanical thod" of arrangement in cell-division not to be entertained.

Before we describe the *growth and aturation of the ovum*, we believe it ll be advisable to describe

The General Manner of Division of nimal Cells.—The process by which lls divide, and thus multiply, presents ch remarkable and consistent features at it should be shortly reviewed. The ocess is called by the polysyllabic word *riokinesis*. It is the typical method all division or "reproduction" of an- al cells. By following each step one ill be dumbfounded by the simple or- rly complexity possible in such minute ace. By understanding the process e can understand more easily the prep- ration of the sperm and germ cells, nd the true reproduction of a new in- ividual by the union of the latter. he essential matter to be divided, and econstituted in new cells resides in the ipe or ready nucleus, or mother-nucleus, rom which daughter-nuclei are pro- uced, as follows:

1. In the quiescent mother-nucleus e observe a *network or reticulation* of a lose coiled tangle—the chromatic matter.

2. When activity appears we observe change. The close network seems to ather into (*a*) a *close* skein of fine convo- uted filaments. This is followed by (*b*) more *open* skein of thicker filaments. The looped ends of these are arranged ound one pole, there presenting a starred ppearance; the ends interdigitate at the ther opposite or anti-pole.

At this period the remarkable spindle (of achromatic material) appears in the nucleus at the pole round which the looped (starred) ends are. It lies ob- liquely across the polar area. Its origin is either in the nucleus or adjacent proto- plasm. It now moves obliquely across the polar area, and toward the middle of the nucleus where it sets itself up in the midst of the chromatine filaments with sen ⁱ directed to the pole and anti-pole.

3. In this movement it is accom- panied by the chromatic filaments, which arrange themselves by their former polar looped ends around the middle or equatorial circumference of the spindle. The filaments become gathered together and much shortened and thickened in this act. The doubled up filaments are grad- ually set around the spindle. These loops then exhibit a *clearage* in their en- tire extent or length, being cleft evenly and equally; and behave in a peculiar manner in consequence. The halves are however, not yet completely separated, but still lie close to each other.

4. The free ends of the V-shaped and split loops are directed outward from the equator. This is the stellate, *aster* or monaster stage of the process we are fol- lowing.

5. There is next the divergence (or metakineses) from equatorial attach- ment of the chromatic material.

This is a process of separation of the cleft chromatic filaments, as if each be- came, by their middle (loop end), at their points of equatorial attachment, moored to the spindle threads, each half filament to a thread from the opposite pole.

6. These threads seem to have strong retractile power, for the apices of each cleft or half-looped filament is now drawn toward the opposite poles, and the *free ends* of each cleft loop are in their move- ment of complete sundering, apparently drawn in toward the equator, where they (the free ends) soon bid farewell to each other, around the spindle or equatorial plane of segmentation.

During this time the threads of the spindle have been more rapidly retracted, and the halved chromosomes in each di- vision are, toward the narrowing ends of the spindle, as rapidly approaching each other, to form each a new star at each pole. Thus is accomplished the converg- ence of the V-shaped halved loops to the poles, completing the *double aster* stage.

Left in the track of retraction appear lines of connection between the retreat- ing loops. These are now supposed to be from the chromatin filaments and not from the spindle threads.

7. The next stages are just the re- verse, in order, of the two first. We

Digitized by Google

have the (*b*) *open skein* in each daughter-nucleus followed by the (*a*) *close* skein in the same.

8. Last we have the network or reticulation of the daughter-nucleus, with its intimate anastomosing, as it enters its normal state of rest (metabolism). Note in this process there is no intermediate rest during the equatorial stage.

With the retraction or divergence of the chromatin, division of the protoplasm of the mother cell, takes place in the same equatorial plane the separation of the diasters and the enclosure of each separately as perfected daughter cells; fitted to grow, and in turn, become mother cells, repeating the division by the same process of kariokineses.

The polar centrosomes to which the spindle threads converge are also worth study. There is one at either pole. When the daughter cells attain their independence, each of the latter have only one centrosome. That now proceeds to divide, *forming two*. Each of these eventually become located at the poles of the new daughter cell. This may explain the formation and behavior of the spindle from its polar to its central position in the cell in its process of division.

Following the chromatic matter alone in its behavior we find the following progressive stages, 1, 2, 3, have complementary retrogressive stages 4, 5, 6.

(Divergence or Metakinesis.)

We may now return to the

Growth of the Ovum.—When the ovum is very young, quite generally it presents some such features as are seen in an amœboid cell, that is, without definite outline. In some cases this phase persists for a longer time. In the simplest animals, however, this amœboid phase constantly exhibits an inclination to pass into a condition of repose. It becomes, in fact, encysted, *i. e.*, enclosed by a sac of more or less definite outline or shape, and less inclined to "float." So it is, with *ova*, which, though at first frequently resembling various forms of amœboid cells, tend more or less rapidly to pass into the encysted phase. The protoplasm no longer disports or disposes itself in irregular changeable masses, or finger-like processes, but becomes "gathered up into a sphere, rounded off, and enclosed by a more or less definite envelope. This transition from a state of relative equilibrium between activity and passivity, to one in which passivity undoubtedly preponderates, is associated with an increase of nutriment and reserve products." The ovum feeds, becomes "gravid"—heavy with stored capital, less active, and more encysted in consequence.

Maturation of the Ovum.—When the ovum has attained its "adult" size, this maturation or ripening is attended by an occurrence that is pregnant with significance, and demands our most careful attention. The nucleus, previously generally located in the center of the ovum, moves "to the pole" of the (ovum) cell, alters considerably in structure, forms a spindle, and divides by the process of kariokineses described. A minute cell, containing *half* the chromatin nuclear matter, and a small amount of protoplasm or cytoplasm, is given off. Further, the nucleus remaining within the ovum repeats the process, a second spindle is formed, and another tiny cell is thrown off, expelled or "extruded." These cells thus thrown off from the nucleus through the (polar) wall of the ovum are called the *polar bodies*, and the process is called *the extrusion* of the polar bodies. These bodies and this process, long disregarded as of no account in any connection of reproduction or inheritance, have, by the researches of recent microscopists, been elevated to a position of the very highest importance. The process is probably of universal occurrence. These "bodies" have a direct significance in the history of reproductive processes, which may be, elementarily, learned herein. Generally the period of extrusion precedes the (after) process of fertilization by or intrusion into the ovum of the spermatozoön.

The minute, extruded cells "never have any history," though occasionally lingering on the outskirts of the ovum. Their eventual fate is to degenerate, dwindle and disappear.

Digitized by Google

The remaining female nucleus is now ready to unite with the male nucleus of the spermatozoön. By the two divisions it has been reduced commensurably in size, but not one whit in complexity, or in the number of its chromatin elements. Its contents have been quartered in quantity, but maintained in qualitative equivalency.

[*Special Features of Ovum.*—The essential part, the nucleus, of the ovum or egg cell, is always extremely small compared with the size of the "egg" itself. The latter in size is governed by the amount of yelk, which is the nutritive capital of the embryo. The yelk is derived from the vascular fluid or surrounding cells or special glands, and is present in varying quantity and disposition. If little, it is diffuse; if much, it is polar or central. The different modes of egg-division are associated with these various positions. Other features of the egg are interesting, but beyond the scope of the subject in hand.]

Here we leave the ovum to describe similarly the structure, composition and preparation of the complementary male sperm.

The Male Element or Sperm.—The sperm, like the ovum, is a cell. It is always, besides, a cell of very definite phase and type. Usually it consists of a small *head*, constituted almost entirely of *nucleus*, and of a long contractile tail. This accessory tail performs the function of a propeller or screw, which induces the movement of the essential head through the media in which it finds itself toward the ripe ovum cell awaiting its arrival.

The head arises from the nucleus of the mother sperm cell, and almost wholly consists of the chromatin elements of the same. The mobile tail arises from the protoplasmic substance or cytoplasm of the mother sperm cell and thus consists of achromatin elements of great dynamic intention. Between the head and tail is a median portional neck connecting both.

Sometimes, as in the threadworm of the horse (*Ascaris*), the head is covered with a cap of protoplasmic nutritive capital, which is doffed before the essential period of fertilization arrives. Sometimes, as in man, the tail is entwined with a fibratile filament. Complexities such as "axial filaments, striations, and the like abound;" these are entirely congruent with later observations as to spermatogenesis and ovogenesis.

[*Special Features of Sperm Cells.*—The sperm cell is highly specialized, active, mobile, of mimimal size, and reduced nutritive supply. Its vitality is remarkable, "not only does it often remain long unexpelled in the male, without loosing its functions, but it may retain its fertilizing power after remaining for weeks, and even months, in the female organism." Certain queen ants are known to have laid fertile eggs thirteen years after their last sexual union with a male. The sperm, taken from a dead male, has actually fertilized an ovum. "Artificial impregnation" (intubation) has been lately successfully accomplished. The sperms can resist great extremes of temperature. The contact with acids has usually a paralyzing effect on them, while alkaline solutions seem to have the opposite result. Spermatozoa have been seen to carry along with them masses of crystals ten times their own size. They have been seen to carry bunches of from eight to ten blood corpuscles. They have been "estimated" to have carried burdens four or five times their own weight without much difficulty or apparent inconvenience.]

The Two Elements Contrasted.—As the sometimes amœboid-like ovum—large, well nourished, passive—is the cellular expression of female characteristics, so in the often infusorian-like sperm are summed up the smaller size, less nutritive habit, predominant activities of the male. As the ovum is usually one of the largest, the sperm is usually one of the smallest of cells. The yelk or food capital and encysting membranes which are often so prominent in the former, are as conspicuously deficient in the latter. The two kinds of cells, though of similar origin, are just as widely opposed in their general features as they are necessarily fundamentally complementary in their history.

Indeed, to present this antithesis by a natural and most striking expression, this oppositeness and complementariness are

Digitized by Google

but exhibitions of what are now familiarly known as *anabolic* and *katabolic* habits. Indeed, Prof. Marcus Hartog (*Contemporary Review*, August) emphasizes this: "This differentiation of size and activity," he says, "is what we term *sex*."

THE PROCESS OF GERM AND SPERM FORMATION THE SAME.

In a general way the process of the maturation of the spermatozoa is that of varied segmentation of a mother sperm cell, with the occurrence of a series of preparatory stages. In detail, however, as a result of most recent observations, it has been found that the process of the maturation of the ovum, involving in that the extrusion of the polar bodies, is paralleled exactly in the maturation or development of the spermatozoa themselves. This seems to us so important that we shall here give, briefly, the story of these more recent, remarkable revelations.

We utilize, for this purpose, the material of the Cartwright Lectures for 1892: "The Present Problems in Evolution and Heredity," by Henry Fairfield Osborn, Sc. D., Da Costa professor of Biology in Columbia college, New York.*

We are informed therein that (at the point at which speculation was, previous to the present awakening, resting—as to the meaning or significance of the polar bodies and their extrusion) speculation was revived by Weismann, who attempted to connect these polar bodies with his "beautiful and simple" theory of heredity, which has caused such a tremendous flutter in scientific circles, and seems to have been advanced as a sort of a base of correction for prevalent theories of evolution. The whole question is clearly given in R. Hertwig's masterly memoir upon 'Ovo and Spermatogenesis in Nematodes,' published 1890. Taking advantage of Boveri's discoveries in staining technique [that is, methods of making the structure of the objects upon the slide of the microscope distinguishable by *staining* or manipulation with coloring matters] and stimulated by Weismann's prediction *that s· ermatozoa would also be found to extrude polar bodies*, this observer examined all stages in the peculiarly favorable germ cells of the thread worm of the horse—*Ascaris megalocephala*." We must here most gratefully and gracefully acknowledge our special indebtedness in these revelations to that so-called degraded parasitical pest that infests our noble friend, the horse. To what grand uses can not mean things be put, and how is not the horse contributing to modern science!

Hertwig made the surprising discovery that ova and spermatozoa are formed in a substantially similar manner by repeated divisions, the single difference being that the *first* and *last* products of division among sperm cells are effective spermatozoa capable of development in fertilization, while the *last* products of division in the ovary are true ova that become fertilized and the first abortive ova, the polar cells, incapable of development. In both ova and spermatozoa the nucleus contains but one-half the chromatin which typical nucleus contains; in the case of *A. megalocephala* each of the germ cells contains but two chromasomes (centers of chromatin elements), while the normal body cells contain four. The manner in which this maturation of the germ cells for conjugation is brought about is as follows: The number of chromasomes in the primary germ cells is four. Then are formed by subdivision the ovum and sperm "mother cells," in which the chromatin substance is doubled, so that we observe eight chromasomes. The mother cells then divide and the chromatin substance is reduced to four rods, a second division rapidly follows whereby the chromatin is reduced to two rods, or half the original quantity. These last divisions take place by the process called kariokinesis* (already described), but, as Hertwig points out, they differ from typical kariokinesis in the fact that the divisions follow so rapidly upon the heels of each other that the vesicular resting period is omitted. Thus, he suggests, is prevented an over-accumulation of chromatin substance prior to the fusion of ovum and sperm. It is evident that the polar cells are rudimentary ova, which do not possess the yolk mass, etc., essen-

*American Naturalist, July and August.

*This polysyllable is made up from the Greek *karyo*—*nut* or *kernel*, and *kinesis* implying *movement*. Hence it means the manner of movements exhibited in the kernel or nucleus.

o development, and are divided off very late stage, sometimes after the has left the ovary, but are in other ects analogous to the spermatozoa. reason these polar cells have not ppeared altogether in either plants nimals is that they originally pos- d a deep physiological importance. he first polar cell subdivides and forms , it follows that from both ovum and m mother cells four daughter cells formed, each containing half the omatin substance of a normal nucleus, he ovary three of these daughter cells rt and the fourth forms a true ovum. the sperm gland, however, all four ghter cells form perfect spermatozoa. s has thus been made out in the *uris*, the different modes of sperma- nesis may be collated with the dif- nt modes of ovum segmentation. phenomena exhibited in sperm de- opment are thus comparable, both ctural and functionally, with polar bula formation. As noted, however, *first results* of division, *i. e.* extru- s of the ovum are abortive; the *last lts* of division of the sperm are all potent. The corresponding portions, last divided remnant of each can be y followed and understood while er observation. But while the rmed-off globules of the ovum die ving the favored individual of the rtet the inheritance of the richly red "lair," the representative of the e among the persisting sperm quar- becomes presumably mixed up as of a now big four and its identity reafter lost. As our information sently is, either member of the sperm four may fertilize the depolarized m. Throwing this distinction aside, head of the sperm corresponds to the polarized nucleus of the ovum—both taining chromatin, the tail of the rm corresponding to the cytoplasm the ovum.

Osborn remarks: "The whole process the extrusion of the polar bodies, is bably an inheritance or survival of a mitive condition in which all four ova the four spermatozoa were fully ctional." Hartog takes a similar w regarding the polar bodies as sim- y ab-ed functionless ova, and ex- presses his view in the following suggestive parallel: "To take a familiar explanation, we may easily conceive a breed of cats that had only enough milk for one litter; should we ascribe the continued production of three or four extra kittens, always doomed to starvation, to a physiological excretion, or rather to the inheritance from a race of better milkers?" These quotations may help to fix the polar bodies in the mind. Weismann's views, which the above seek to controvert, require special treatment. It may have been observed that frequent allusion has been made to his views in recent numbers of the MONTHLY.

We must now return to the doubly reduced germ and sperm elements to follow the phenomena attending the performance of their essential purpose.

The Courtship and Union of the Male and Female.—Fertilization is the consummation of the essential purpose of the ovum and sperm. It consists in the ultimate union of a spermatozoön with the reduced nucleus of the ovum. The male element it is that has to find out the ovum to effect an entrance and union therein with the depolarized nucleus. This is the result of the former being the active element and the latter the passive. The design of intrusion and its process are worthy of being emphasized here. As we have seen, the male element is without a nutritive store, while the female element is well provided in that particular. This may very probably be the main determining attraction of the sperm—stripped as it were of all personal impedimenta—for the ovum.

The devices by means of which the sperm reaches the ovum are diverse and difficult to determine. When it has come, by any of its devious diverse methods into proximity to the ovum, it is believable that "there is a strong osmotic (a sort of diffusion) attraction set up between the two complementary elements." The distance over which the minute sperm has to travel in order to reach its restful haven is usually quite long. But its active katabolic persistence, with its extreme vitality, which are its "natural inheritance," enables it, in wonderfully short time, to get there effectually.

The point at which the minute male

Digitized by Google

"animalcule"-like organism intrudes or penetrates the ovum does not seem to particularly have been defined. Whether it takes advantage of the point of extrusion of the polar bodies—where the nucleus becomes contiguous to the wall of the ovum—we are in doubt. A special aperture, the *micropyle*, however, exists in some ova for this purpose. The nucleus, too, seems to retreat from its position assumed during the extrusion of the polar bodies, to its former more central position. Whatever all these changes may be, it is certain that as soon as one sperm has entered the ovum a reaction at once sets in so that the door, as it were, is shut to and barred against the entrance of any further solicitor. Here we see that the ovum is receptive, as the rule, to only one suitor. That is another point of special interest.

This courtship and union is controlled apparently by a highly proper monogomous principle throughout. This has its most patent demonstration in the highest forms of life. In the very highest, the principle is also (morally) supreme.

Immediate Results of Union.—Each original element, sperm as well as ovum, we have seen has been reduced one-fourth. In each there is exactly a corresponding process of rearrangement, leading to opposite but complementary results. The essential part of each is that portion which contains the chromatin elements. The essential *head* of the spermatozoön it is that contains the chromatin matter, and becomes the male complement to the doubly-reduced (depolarized) ovum nucleus, likewise containing chromatin. The reader must keep his mind continually on these chromatin elements. They are all and ever important.

"After the sperm-nucleus has penetrated to the center of the ovum, and after the extrusion of the polar bodies is quite completed, we have to deal with two nuclei, not only closely approximate in structure, but alike in future history." As seen in a familiar type of reproduction both male and female nuclei contain two chromatin elements in the form of bent rods.

(1) *Before union* takes place these undergo a marked modification the same in both cases. Round the chromatin rods vacuoles are formed, limiting them from the surrounding protoplasm. Into these the rods send out (apparently) anastomosing processes. Gradually the rods form themselves into a network in the meshes of which minute nuceloli or nodes of network are also demonstrable and finally into "loops."

(2) The two pro-nuclei, thus modified, having come together, do so most precisely—"fuse." Each pro-nucleus forms half of that spindle figure with starred appearance that almost all nuclei take when about to divide. This double spindle figure is the "segmentation nucleus" which will presently divide into the two daughter cells. In the plane of the equatorial plate during the process of this arrangement about the middle of the (doubly derived) nucleus the characteristic cleavage (without separation) of the filaments, usually V-shaped, appears.

(3) In the spindle the nuclear elements still distinguished in their orderly *stellate* behavior, as male and female, eventually form what is known as the "equatorial plate," lying across the center of the spindle. This is a well-demonstrated stage, and one characterized by a well-marked equilibrium. It is the resting stage *par excellence* in the life of the mother cell. Movement is at an end, a state of stability has set in, and this would continue *ad infinitum*, did not a factor which hitherto has played no part, assert itself and bring about fresh movement.

(4) This new movement is the longitudinal *separation* of the already cleft chromatin elements, an independent expression of life—indeed a reproductive act—on the part of the nuclear elements.

(5) This fully indicated vertical splitting of each rod into a loop or link precedes the horizontal *divergence*. "Thus," says Osborn, "we may conceive of a thorough redistribution of the chromatin before it passes into the daughter cells." The split loops are each retracted or diverted toward the centrosome—the movement that suggested to some authors the possession of a contractile power (intracellular muscularity) in the archoplasmic threads, each chromosome being appa-

Digitized by Google

ıtly withdrawn by a single thread. e horizontal divergence (metakinesis) breaking up consequent on the hauling vard the poles of the complementary pple rods now is exhibited, and as chromosomes separate into the double ıs, lines also appear between their di-ging ends. These, sometimes termed erzonal, are now believed to arise or secreted from the chromosomes them-ves. There is, therefore, some differ-ce of opinion as to what the mechanics the chromosome divisions really are. (6) The chromatin is now retracted o two coiled threads, each the center *kernel* of the daughter-nucleus with a gle centrosome beside it. As the line divergence (horizontal splitting or rrowing) is drawn between the two lls (in the plane of the equatorial plate) e single centrosome (aster attractive here) in each cell itself divides, so that ch daughter cell is now complete with chromatin coil and two archoplasmic ntrosomes. This protoplasm of the um is also being furrowed and con-ricted till the two new daughter cells e perfectly independent by the forma-on of a cell plate completely forming e two "blastomeres."

"It thus appears that both the chromatin ıd archoplasm are permanent elements of ıecell, such as we formerly considered the ucleus; the apparently passive chroma-n is divided with great precision by the tive archoplasm, then the archoplasm mply splits in two to resume the cleav-ge function" in future division.

The above described process of division, reproduction, consequent on the fertili-ation of the ovum by the conjugation of he male and female pro-nuclei, can be ollated with that of the kariokinesis of ingle-cell division, repetition. The pecial difference is the absence of a rest-ng stage or prolonged equatorial appear-nce in the latter, and the marked rest-ng stage prolonged equatorial appear-nce in the former. The resting stage as thus apparently more meaning than as yet been supposed.

The Constitution of the Material Basis of Heredity.—It is beyond our concep-tion to form any idea of the microcosmic nucleus of the fertilized ovum. In the mar subject it is less than $\frac{1}{2500}$ of an inch in diameter. This "is yet capable of producing hundreds of thousands of cells like itself, as well as all the unlike cells of the adult organism." This nucleus contains within itself not only the tendencies of the present type, but of past types far distant. And that in two lines of descent male and female, contributing each their hereditary pro-portions.

Weismann says: "We do not see the molecular structure of the nucleoplasm (or chromatine), but something which we can only look upon—when we remember how complex this structure must be—as a very rough expression of its quality. Our most powerful and best lenses just enable us to make out the forms of separ-ate stainable granules present on a loop which is about to divide. They appear as spheres, and immediately thereafter, on division, as hemispheres. But, accord-ing to Strasburger, these granules, the so-called microsomata, only serve for the nutrition of the nuclear substance proper, which lies between them as unstainable, and therefore not distinctly visible. But even if these granules representing the true germplasm, though divided into two exactly equal parts, would give no proof of equality on inequality in their consti-tution, it would give us an idea of their qualitative relations." We can only ob-tain proofs as to the quality of the molec-ular structure of the two halves by their effect on the bodies of the daughter cells, and we know that these latter are fre-quently different in size and quality." ("Essays on Heredity," first edition.) He believes "there are variations in the molecular constitution" of the nucleo-plasm, remarking that such a view is obvious, because the nature of the polar body is different from that of the egg cell.

It has been demonstrated that even in so minute a space as the one-thousandth of a cubic millimetre there are 400,-000,000 of these molecules or granules. It is certainly very evident from such demonstration that the constitution of the chromatin coils that we see arrang-ing themselves into cleft loops must be of a most particular nature, of which we have not yet the faintest idea. It is evi-dently capable of summing up the essen-

Digitized by Google

tials of an infinity of variety. Our knowledge in regard to this material is limited. As the future furnishes improved means of observation, an advance of knowledge concerning this, the material basis of inheritance may be expected. We must wait patiently, full of faith in our developing powers of overcoming impossibilities.

Some Special Features.—A remarkable and significant fact may be noted here, that the number of chromasomes varies in the cells of different species, and even in the cells of different varieties (as in the threadworm of the horse—*A. megalocephala*), but is constant in all the cells of the same variety through all stages; thus the same number of chromasomes appears in the first segmentation of the fertilized ovum, as in the subsequent cell division in the tissues.

In the cell substance of the ovum occurs the existence of two central corpuscles (centrosomes or attractive spheres) in the protoplasm. These serve as points of insertion for protoplasmic threads (radiating filaments), which exert a "muscular action" upon the nuclear elements in the forthcoming division. The history of the special kind of protoplasm, the archoplasm giving origin to these appearances, has been traced with great care. It has its center in either central corpuscle, and sends out contractile fibrils, which moor themselves to the nuclear elements. The movements of the latter during the forthcoming first division of the ovum are directly referable to the antagonistic action of these fibrils, and thus we have hints of the intracellular muscularity, the thought of which makes one dumb.

Relation to Sex, etc. — Further, "There is no line between male and female, the conjugating cells are simply in a similar physiological condition wherein a mingling of hereditary characters affords a new lease of life," and, "the cells born by the two sexes are absolutely neutral, so far as sex is concerned. The causes finally determining sex may come surprisingly late in development." [See article "Sex," July MONTHLY.]

The wide difference in the ultimate form of the germ cells of the male and female is a result of physiological division of labor, the mass and yelk of the ovum having been differentiated to support the early stages of development (arising out of the nucleus), while the spermatozoön has dispensed with all these accessories and acquired an active vibratile form for its function of reaching and penetrating the ovum; so that sex has evolved from the necessity of cell conjugation, in which, as higher plains are reached, individuality has been bestowed on the sexes. But coming back to the essential feature of conjugation, we see in the highest and lowest forms of "sexual" reproduction the same, which is even similar to other forms of asexual, or simply conjunction of similar cells. The ovum may indeed be said to just as fully vitalize the spermatozoön, as the spermatozoön the ovum. The action and reaction of the two hereditary substances may be considered equal and mutual, so far as we yet know. So that "if it were possible to introduce the female pro-nucleus of an egg into another egg of the same species, immediately after the transformation of the nucleus of the latter into the female pronucleus, it is very probable that the two nuclei would conjugate just as if a fertilizing sperm-nucleus had penetrated. If this were so, the direct proof that egg-nucleus and sperm-nucleus are identical would be furnished" [Weismann]. Boveri actually succeeded in accomplishing such a similar feat by depriving an ovum of its nucleus, and subsequently causing it to develop by admitting *two spermatozoa*, which fertilized each other and produced a complete individual!

THE NEW INDIVIDUAL EARLY STAGES.

The satisfaction of the reader demands, as indeed completeness prescribes, that we follow the process of the growth of the individual reproduced, a few steps further.

The development of the cell is a gradual progress, says Huxley, from a general to a special state. The like holds good of the development of the body as a whole. However complicated one of the higher animals may be, it begins its separate existence under the form of a nucleated cell. This, by divis-

Digitized by Google

, becomes converted into an aggregate nucleated cells. The parts of this gregate, following different laws of owth and multiplication, give rise to rudiments of organs; and the parts these rudiments again take on these des of growth, multiplication and tamorphoses which are needful to con- rt the rudiment into the perfect struct- e. The development of the animal as whole then repeats in principle the velopment of the cell. In short, the rm may undergo division and be con- rted into an aggregate of cells. Devel- ment is a process of differentiation by ich the primitively similar parts of the ing body become more and more un- e one another.

The above, in the words of the dis- guished demonstrator of *protoplasm* the physical basis of life, indicates, in general way, the growth from simple lls to complex differentiation of the ghest, most specialized of animals. his can be a little more specifically de- ribed, as follows:

After the initial division of the ovum, ntaining the united nuclei, the same ocess of cell division now repeats itself veral times in succession. In this way om *two* cells there arise *four;* from ur, *eight;* from eight, *sixteen;* from six- en, *thirty-two;* from thirty-two, *sixty ur*, and so on. "Each time the divis- n of the 'kernel speck' chromatic coil recedes that of the nucleus, and that of e ovum protoplasm." [Haeckel.]

Finally, through the continued divis- n or furrowing of the mammalian egg, here arises a mulberry-shaped ball of *imilar cells.* These cells are the mate- ials out of which the body of the young ammal is constructed. This mulberry- ike ball of cells is called, from its like- ess to that form, a *morula.* Its com- onent cells are arranged so that there s no vacant space or cavity. At other imes the cells arrange themselves in a nanner so as to have a spacious cavity, which form is called a *blastula.*

The next stage is the formation of what is called a *gastrula*, in which is seen he formation of two germinal layers, named below. In the case of the blastula, his is effected by a process of invagina- n or dimpling, as might be done by pressing in, with the finger, a hollow rubber ball. This condition is named an *embole.* In the case of the morula the gastrula is formed by a process denominated overgrowth, by which the smaller, less yelk-laden cells gradually grow round the large yelk, containing cells by superaddition. This is called an *epibole.*

A further stage exhibits the determination of these infolding or superadded cells into two *germinal layers.* The outer of these is called the *ectoderm* or *epiblast*, and the inner the *endoderm* or *hypoblast.* A later stage sees the formation of a middle layer called the *mesoderm.*

The eye may help to aid the memory as to the above, thus

Primitive Blastoderm.	Ectoderm or Epiblast.	1. Sensorial.	Secondary Blastoderm.
	Mesoderm or Mesoblast.	2. Body cells.	
		3. Visceral Wall.	
	Endoderm or Hypoblast.	4. Intestinal.	

1. Cuticular system and central organs of nervous system (*cerebro-spinal*).

2. True skin, voluntary muscles, and skeleton.

3. Contractile wall of alimentary canal, heart, large blood vessels, vascular glands, premordial kidneys and *generative organs.*

4. Epithelial lining of alimentary canal, air passages and cellular parts of internal glands.

It is thus eventually from the middle or last formed layer that the germ cells of the newly started individual arise, usually on an area of the epithelium lining the body cavity. The new germ cells thus appear comparatively late in development and after "differentiation" has made considerable progress.

The object is apparently one of expediency—to form and furnish the house first, making it ready for the reproductive occupants, whose maturity is being secured, so that it is just commencing life (puberty), as it were, on the comparative maturity of the body itself.

Thus we can see how the idea of a distinction between the origin of germ cells and of body cells would suggest itself. We can further see, by following the daughter-nuclei into the morula and

Digitized by Google

thence into the gastrula, with its three layers—the starting points of all future differentiations of organs and tissues—that *all* the cells of the new individual must contain not only hereditary matter, but that even in male and female portions. This matter—the chromatin filaments, loops or rods or coil, in fact *the mortal coil*, is what is considered to continue one generation of the race after another, we had almost said, was continued through each generation to another. But there, indeed, is the great point: Are the germ cells that appear in the sexual glands at a comparatively late stage on the general differentiation continued in lineal descent from the original pro-nuclie?

With that query we may meantime rest. We have presented the known facts, the material basis on which the modern theories of heredity are and must be founded.

METHODS ON THE HORSE FARM.

BY RAY MARSHALL.

EVERY horseman has his own ideas of business. Nearly all are aware that sometimes the methods of one would not be suitable for some other. The situation of the operator of a horse farm has much to do with the methods which he could find it profitable to employ. The quality of the soil makes often a very great difference in the plans that may be followed in getting the fullest profit from a given number of acres. In the case of uniformly deep, rich soil an owner will find often that it is desirable to devote a good share of the ground to growing grain and provender for the winter feeding.

In this connection, however, the value of the land per acre and the price at which grain, hay, etc., may be bought from the grain-growers who make a business of selling it, has much to do with forming the policy best to be adopted. Where corn and oats are to be bought delivered at the stock farm at an average price below 30 cents per bushel in territory west of Ohio, and at below 50 cents in the East, it is usually the better policy to buy grain almost exclusively. The distance of the farm, however, from a good town and railway station has much to do with deciding this question. The condition of the roads, too, through the farm districts must be considered. In parts of the country there are times when protracted rains and the resulting mud would make it impossible to have grain delivered for several weeks in the year. This contingency might be usually avoided by laying in a stock of grain for the coming year immediately after harvest, when the roads are seldom out of condition. It is often true, however, that those who have grain to sell, discovering one's policy of buying at a fixed time, may insist on a price for their grain and other feeding material that is away beyond reason. In many localities it is the better policy where the grain is bought instead of being grown upon a farm, to secure it from time to time as it is needed. The capital invested from six to nine months in a large amount of grain requires that the price of buying in the early autumn be low enough to permit the grain to shrink, and to allow for interest on the money while invested, as well as to allow for waste of the grain. The risk of having the grain destroyed by fire, as well as that of damage by rains and from other causes, such as dampness at the time it is stored, must be taken into account. It is one of the surprising things in life, that farmers who have grain to sell early in the season are more loath to dispose of it to a proprietor of a stock farm, perhaps adjoining that of the grain-grower than to sell at the railway station to be shipped out of the country. Because of this fact, it is not unusual for the manager of a stock farm to buy his grain through the regular buyer in town. The inconsistency of the seller drawing his grain by the stockman's door, and a considerable further distance to town, in preference to selling it at the same price to the stockman, is one of the anomalies which are beyond explanation. If the question of buying hay and having it drawn a considerable distance is considered, still more thought of the contingencies that

Digitized by Google

are probable in the case from year to year is necessary.

The first important thing to take into account is the most economical method of providing the food supply for the stock. When the cost of growing the grain on the farm and that of buying it from the outside are about equal, the decision then is not always safely determined in favor of buying from the outside. If the manager has a considerable family of boys that are old enough to do a good share of the field work, and if they have the disposition to do his labor cheerfully, it is a serious question whether it is not best to grow the grain instead of buying. The matter of providing moderate and steady work for the mares is thus provided for. Where the blood lines of the breeding stock are of only the commoner strains, this would seem to be a condition calling for a considerable amount of food growing on the farm. It is true usually that not all of the farmer's boys will have special inclination to handling and training colts. In such cases, there is opportunity to divide up the work into departments, giving scope to the desires of those not in complete touch with the equine spirit. It is to be remembered also that the matter of providing water on a large farm throughout the year has in places great importance. It is not unusual to be compelled to expend hundreds and even thousands of dollars in sinking a deep well, and after this is accomplished there are times when the pumping apparatus is out of condition for several days, and the dry situation assumes serious proportions. The farmer who will be on his guard against this emergency must usually bear the further expense of providing a large cistern, and piping the roof of his barn to provide a reserve supply of water for the emergencies mentioned as well as for the failure of the wind and other agencies to do their part. In view of the fact that a large amount of work must be performed in the way of pumping by hand on the occasions of drouth, it is at least in such times that an investment of a part of one's capital in land for growing grain is preferable to a large investment in live stock and grain with only a moderate amount of ground for pastures. In this connection it may be mentioned that the drouth frequently requires in the early autumn months that the stock be provided with soiling crops to supplement the parched pastures. Great inconvenience follows in such cases, if the fresh hay, clover or corn, soiled fresh from the field can not be supplied. It is particularly desirable in the case of broodmares and their young in such situations that they have a full supply of food material, as there is a no more critical period in all the year when the growth of the youngster may be checked, when the dam may lose flesh that can be recovered with difficulty within the following year. It would seem to be in both cases by far the best policy to plan for growing all the hay, and from a third to half of the grain required on a stock farm, thus being dependent upon the outside for only a part of the grain and provender required. Then in the emergencies of failures of grain crops or hay, there will, as a rule, during all the grazing seasons, be on the farm a ready food supply, whenever any deficiency is to be supplemented.

Whether or not it pays to own a large number of broodmares and breed the youngsters one desires in preference to the policy of buying at weaning time or as yearlings, there is quite a diversity of opinion. It is argued by those, who breed almost exclusively that one has the advantage through a series of years, of a knowledge of the ancestry of his stock through several preceding generations. It is felt that this acquaintance with the history of the stock that is to be sold puts one in a much safer position to know what he is doing and what he is recommending. For instance, if one is selling a half-grown horse to a buyer who intends to speed the animal, expecting great results, the seller is able to tell, if so disposed, all the facts of the history of the ancestors, often from personal recollection of the traits, and peculiarities of gait, disposition and mien of the various members in the immediate branches of the pedigree. As an illustration of this, a case came under our observation during the last year, where an owner sold a standard producing filly,

Digitized by Google

at two years of age, to a professional driver for a price double the amount which might otherwise have been realized, simply by assuring him of the trotting habit in the dam and the grandam of the animal in question. The outcome of the case was very satisfactory, from the fact that the filly proved square-gaited from the start and gave immediate promise of a good development of the desirable going qualities. This advantage applies mainly to the proprietor, who plans deliberately to do a straightforward business, and who is conscientious at every turn of his proceedings to state the truth as it is. There would be not only the advantage of selling, at good margins, the animals with a favorable record, but also the disadvantage of being compelled if true to his convictions, when required to state the bad history in some cases, and on this account dispose of some of his surplus without any margins of profit, perhaps even at a loss. With care as to the broodmares one keeps, this latter difficulty need be of only rare occurence. In the matter of uncertainty in the results of breeding by reason of the unfavorable outcome of "mating," following the uncontrollable laws of variation, one must expect occasional disappointments. But surely, if any one is to be able to judge the outcome of experiments in breeding, it is the man who has owned and been intimately acquainted with several generations of the immediate and perhaps more remote progenitors. A good share of the pleasure in handling the equine comes from the anticipatiou of expected results in applying the breeder's science. Systematic knowledge of the problems of breeding can but be of great advantage, when applied along the line of correct methods of procedure on the breeding farm. It is therefore to be considered that while the breeder may often feel disappointed in the appearance of the youngsters on whom he has counted highly for special conformation, yet there is room in unpleasant appearances for an outcome truly surprising. In this connection it is to be remembered that the trotter which sold for $105,000 was not a very promising phenomenon until past the age of two years. The sire was also several years older, before his inherent breeding qualities gave him great distinction. It is thus with the animal kingdom as with humanity that we can not judge the posibilities from first impressions, drawn from early appearances. Some of the most successful drivers and trainers profess to know nothing and to be unable to judge of the conformation of a youngster or even a mature animal, as to its power of endurance or its possessions of the various qualities required for high speeding. The breeder therefore who nurtures carefully a sorry looking but lively colt never knows certainly the outcome of his possessions.

On the other hand, the man who owns but a few broodmares and depends largely on buying his young stock for growth development and training, has certainly the advantage of being able to present, at times, what may be termed a magnificient appearance of his animals. He need not as a rule for a few months, perhaps years, have anything that is off in color or that is seriously defective in the way of chronic disease or blemishes; and with unlimited capital he may bring together a collection which will enable the issuing of a superlatively attractive catalogue.

The satisfaction in such a situation of being able to show one's friends the stock which he has selected affords certainly a superficial glare of brilliancy. The majority of one's friends will accord him the credit of being truly a genius in the art of making collections. The majority too, will probably think on one who succeeds in this line, as attaining greater distinction than the breeder, but so far as the highest success is concerned when everything is considered, of those who follow this line of buying their stock mainly, and thus assume the role of jobbers in the horse world, they who accomplish great things will be accompanied by many unsuccessful co-laborers. It is to be remembered that in the case of a farmer, who buys youngsters and holds them for two or three years for development and training expecting eventually a good profit from his business investment, that there are disappointments in store for him as well as for the professional breeder. Health is impaired

and constitutions are undermined by exposure, and blemishes result as well from the accidents attendant upon the handling and the contact of numerous animals with each other. By the time one has conducted an establishment for buying and selling, during a period of ten years or more the accumulations of animals with disagreeable defects will be somewhat astonishing to those you are most sanguine. There is a field, however, not yet occupied extensively by dealers, in which the interest of horse breeding could be very much benefited, viz.: that of buying the crippled and blemished broodmares as well as those of not-to-be-improved dispositions, and taking them clear out of the breeding world. Could they, by calling to their aid the veterinarian's art, completely destroy the power of reproducing themselves, the future would be very grateful for the improvement that could but follow in the drivers' and work animals that are to do much of the future service in the carriages, express wagons and other vehicles of pleasure driving and business locomotion. It is true, however, that the majority of fanciers of horses are only fitted for the calling of dealers and incidental breeders, and the field will no doubt be always well filled. It is probable, too, that the persistent breeder, who applies system to his work at every turn, will never have to contend with very serious rivalry. For such breeders lovers of domestic animals have the highest respect.

The great fault on many stock farms is lack of men to do the work properly. Not only is there deficiency in the number of men and boys required, but there is too often indifference in selecting the best men as regards character and industry. Some managers are too easily captivated by the glib tongue and the amusing manner of the applicants for positions as helpers and handlers of the horses. It is a safe rule where more than fifty horses are kept in more than one establishment to employ at least one extra man to be used as a substitute. On occasions in which by reason of sickness among the regular employes, and in case also there should be epidemic sickness among the animals, there is always room for the substitute almost every day of the year. It is poor economy to overwork the men, and in the end it will be found far more profitable to provide a sufficient number of workers that each may close his day's work in a cheerful spirit. As a rule the man who is disposed to strike for higher wages and to be discontented is the one who is not over-worked. Yet there is the difficulty of aggravating the best employe by putting too heavy burdens upon him. Lack of system in handling a force of men is a frequent source of trouble. As a rule each man should have definite work for which he alone is to be responsible. In cases where one is particularly skillful and performs his task in a brief time compared with the others it is unfair to deliberately give extra employment without additional compensation in some way. This policy would discourage alacrity and skill in that it would lead to the adoption by the men of a deliberate scheme to protract the time of their work to avoid any additional labors. The employer, of course, or his foreman in the case of unusually large establishments, needs to guard in turn against imposition and should know about what an average man should do in a given time, and have it understood when a man is engaged that he is to do a specified amount of work daily as a rule. In this way much of the contention which too often arises between the employer and his men may be avoided. It is important to encourage skill in every man. To this end especial effort should be made to induce each and every one to make a careful study to improve himself in his work. Books and reading matter pertaining to the horse, his care and management, can not be too freely provided in a pleasant reading room for such men. In our modern times, if possible, it is always desirable to employ only the men with brains and disposition to improve themselves mentally in their work from day to day. A gradation of salaries for the men which recognizes skill and fidelity, as well as continued year after year's service under the same employer, usually incites the men to effort in this direction. In addition to the policy of reading and seeking instruction, it as fully as important to take account of native ability in some of the men who seem to be indiffer-

Digitized by Google

ent about seeking knowledge from books. A man is found sometimes who "picks up" much real information, we hardly know how, and is apt to apply all that he knows so much more effectually than do some of the voluminous readers that, in cases, it is more to be commended in one that he makes the best use of his limited knowledge, whereas others who know more in proportion to that knowledge do much less than the other. Tact and talent in modern times, as of old, accomplish wonders where there is opportunity for their employment. But the brighter polish that is given to minds of such workmen should always enable them to be still more valuable. Dissipation in the workmen can not be tolerated, except for a brief time in emergencies. The sooner the policy of requiring sobriety in all the work about the establishment is adopted, the sooner will one great source of accident be shut off.

The accidents on a stock farm are very numerous in too many instances. Some managers never expect anything else than that some one shall be hurt, or some of the animals damaged in some fracas about the barns or in the form of a runaway on the highway or in the field. It is certainly no credit to an establishment to have frequent accidents of this kind. It indicates a lack of system and thoughtfulness to anticipate the emergencies which too often arise. Every man should be taught soon after entering on his work how to avoid many of the ordinary accidents liable to affect himself, and it should be only an unheard-of emergency, as a rule, that should offer an occasion for any mishap to either the men or the animals. Whenever there is an unruly animal that is disposed to be belligerent when turned in the yard or pastures with other horses, immediate application of some of the modern appliances to prevent the evils of kicking, striking, etc., should be brought into service. In the handling of strange horses not owned on the farm, it is always a safe rule to use hobbles and take no risks whatever. While it is true that not more than one case in twenty may require it, the score of cases of precaution are the means of avoiding disasters when this one case of trouble arises. In this matter of outside work in breed- it is only a question of rigid rules in regard to the handling of mares from outside farms and others, that much of the repeated service may be avoided. In this as in other affairs of business, if the owner can not observe rules which are to his own advantage as well as that of the breeding establishment, his patronage may as well be omitted. In cases of mares and fillies brought several miles for breeding, the return the same day should seldom be expected, and especially not until after several hours of rest and quiet in a secluded darkened stall. It is always better too, especially in the case of fillies, that they be retained for several weeks on the breeding farm. The strict application of all rules of precaution with regard to both the sire and the mares can not be too strenuously insisted upon.

Much occasion for anxiety arises on the average farm from abortions, but a careful observation of these cases usually shows that the trouble arises from neglect upon the part of the managers, rather than from any epidemic. The food of the mares has much to do with this trouble; the pastures can not be too carefully guarded, nor can the use of oil meal, millet and various other foods be allowed except under very careful regulations. In this difficulty, as in others in life, prevention is by far more important then possible cure. Strict account should be kept of every female, and no dispatcher of railway trains should be more familiar with his forces than should the manager or foreman of a farm be with his numerous horses. It is not a hopeless task where the trouble has occurred one year to avoid the same trouble the successive season by the use of some preventive food or condiment. In the matter of preventing this trouble and others where the stock runs in the pastures and lots, nothing is to be more carefully observed than the fencing. Where it is so low as to tempt a mare to jump over it, there is particular danger. Where there is barbed wire even though sufficiently high, deserves care; the nervous starts which a scratch or the anticipation of it make the latter trouble almost as productive of the evil

Digitized by Google

as the former. A muddy brook in the pastures often leads to straining or to evils from overexertion of the animals wading through it. The most desirable agency of prevention of numerous ills on the stock farm is a good roomy stall for each animal at nighttime. This is the only reasonably sure precaution against accidents at night. The most sensible horse can not be blamed for being occasionally frightened in the dark, and perhaps from maiming a fellow horse under a misapprehension of evil intention. As long as there is daylight the average horse has brains enough to know about what is the right thing and with the proper training and handling there need be but few accidents. However, with all the appliances of modern invention with animals of the very best disposition, and with the business in charge of a foreman of extensive experience and with a heart in sympathy with every desire of his animals, there is one thing especially needful. This desideratum is skill. The manager needs a double portion of it if possible as compared with any of his assistants. The more of it to be found among the helpers, the better results are to be expected from the outcome of every year's work. Owners of horses are learning more and more that the value of their animals over and above the actual cost of production lies largely in a trained disposition. If one can imagine a man who has grown to the age of maturity, without having had any training whatever more than to simply eat his food and cover his nakedness for comfort, having had none of the feelings of responsibility for his own preservation from day to day, and of tender regard for the welfare of his fellow-beings, he is in position to consider a horse grown to maturity with no attention other than having had its supply of food. When it is remembered that many of the horses of to-day are descended from the original wild horse which knew no master, and that through the various grades of descent only a semi-barbarous system of breaking after the animal has come to mature years has been employed, it is not to be wondered that animals are found occasionally that are difficult to conquer under the most favorable surroundings. The trainer of this noble animal has many suggestions to be found in the printed pages, which are of value, and no one should habitually handle the untrained animals without this information. If the skill arising from the practice in the work of training, and which is accompanied by a real love of the labor necessarily often arduous, is rightly employed, there is after all much relief to the operator who persistently seeks to do everything in the easiest way. It is by observation of the ways of the world that the greatest results oftener follow simple straightforward action as compared with the unusual effort too often exerted with idle returns. It may be safely asserted that one man with the skill which our age of invention renders possible is well worth as an operator in training animals a half dozen unskillful workers.

It is, also, a fact which tourists in Europe observe, that one man in our country in the common labor about the barns will accomplish as much as two or three in the old country. This demonstrates conclusively that the intelligence found among independent workers, who as a rule have sufficient manhood to take pride in their work, is in most situations well worthy the higher price which such, even though partly skilled labor demands.

Pre-eminent on the stock farm, however, of importance is the position of manager. A proprietor who has much other business should not expect to be his own successful manager, except in a general way. Where there is considerable capital invested it is desirable to employ both a manager and a foreman or supervisor of the work besides. The farm can not be shut down, so to speak, as can a factory in the case of emergencies. It matters not what the weather or what may be the trouble that may arise in the way of sickness, storms or flood, it is necessary that the farm animals have their attention. Where there are a score or more of horses there is an emergency every week. With larger numbers new trouble every day in the week may be expected. Where there are fifty horses or more, a night watchman patroling the premises will often need the assistance of two or three of the help at times, and occasionally

that of the manager and the best veterinary skill. A proprietor of a large horse farm admitted to the writer that his foreman with a salary of $2,000 per year saved to his establishment fully five times the amount of his salary by the employment of his knowledge in various branches, which supplemented all the experience of the other workmen. It is thus true that economy is not always in saving of expenditures, nor in having a manager or foreman worn and weary at the close of the day from laborious physical exertion which tends to render the mental faculties in considering and anticipating the work of the night, tomorrow and of the days to come. It was a sensible remark which we heard the owner of a noted breeding farm make to his driver, when he told him that he wanted him to keep his hands off the pitchfork, the curry comb and the harness, and to employ his mind in planning and directing his help to the best effect. Too often proprietors of small establishments in managing their own affairs thus weary themselves in attempting to work with the men, with the idea that their own labor will incite more energy into the workman. In such cases it is too often true that the assistants stand a part of the time with their hands in their pockets admiring the skill of their employers, only emulating his example in a feeble way and seldom aspiring to copy from it. Do the best that one can, there are difficulties enough arising calling for overexertion of the manager's physical energy, so that he is in no danger of rusting out from lack of exercise of his physical powers. For the manager there is labor enough to plan the work of others and to do unusual parts which fall thickly to his lot.

RECOLLECTIONS OF THE GRAND CIRCUIT.

No one feature connected with the rise and progress of the trotting turf has exerted so powerful an influence for good as the chain of trotting meetings known as the grand circuit.

The highest aim of breeders has been to produce a trotter good enough to take "down the line" and win a share of the money and fame that this series of meetings made possible, and the lover of the trotting horse who aspired to be only a spectator looked forward each year to these contests as the greatest exhibitions of trotting to be seen in this or any other country.

The stakes, purses and wagers each year that compose the sinews of war in these great battles amount to a sum represented by millions, but aside from this the opportunity afforded breeders to bring the produce of the stud before the public and make a market for the same has been an impetus and benefit to breeding interests that can not be computed in dollars.

Amid the many noted contests at the different circuit tracks it is difficult to particularize any as superior to all others, and yet an impartial opinion, I think, must award the palm to the series of stake races inaugurated ten years ago by Charter Oak Park, of Hartford, and known as the Charter Oak stake. Ten of these battles royal have now been decided, each for a stake of $10,000, and to say that each had an added value of ten times as much in the wagers would be a very conservative statement. But these vast sums represent only the money value. Money could not buy the pleasure that Mr. C. F. Emery felt when his stallion Patron jogged home winner of the rich prize, nor could all Mr. C. J. Hamlin's millions buy the gratification he felt when for the second time the produce of Village Farm placed the coveted trophy in his possession after the hardest battle ever fought in the series.

It was my good fortune to witness the first race for this rich prize and also those that followed year after year, and many of the incidents will live in my memory while memory lasts.

It seems, as I turn the pages of the past, but a short time since in a gale of wind on a cold raw day I saw the game Director defeat the strong combination just as he had done at Cleveland but a few weeks previous and enroll his name as the first winner of the Charter Oak stake. The stake as originally opened

Digitized by Google

s for the 2:19 class, and enough minations had made good the final yments to add $500 to the stake, thus ring that sum to the fifth horse in the mmary. The day of the race dawned d and gloomy with a strong wind wing that made top coats a necessity comfort. Eight starters appeared to tle for the stake, and the betting blic rated the chances of each to win the following order, and at about these ds: Wilson, $200; Phallas, $100; Di-tor, $60; Clemmie G., $30; Fanny itherspoon, $30; Overman, $15; J. B. omas, $5; Adele Gould, $5. The "tal-t" were on Wilson to a man, and it s understood that any assistance he ght need to make victory sure would t be lacking. Aside from this the lding had been especially prepared for e race under the supervision of his wner, Mr. Z. E. Simmons, and that ntleman said before the race: "If ilson is beaten I have no excuses to fer." Phallas was supposed to be in od form, but he was not strongly sup-rted in the betting, and of Director hn Goldsmith said: "I realize that I ust make my fight alone, but I guess e little horse can take care of himself." plan scarcely expected to win with the ratic Witherspoon, for, as he expressed "Although she has plenty of speed e large field will have a tendency to ake her unsteady."

Adele Gould was assigned the pole ith Witherspoon in second place and e favorite Wilson, at the outside in xth position. To add to this ill-luck lace did not have the gelding well up hen the word was given for the first eat, but he trailed the leaders to the alf, where both Adele Gould and Witherspoon broke. Goldsmith had arted out to "lay up" the heat, but hen the leaders were seen to be in ifficulties both he and Mace began riving, Wilson getting the heat in 2:17½, ut his actual time from wire to wire as one second faster than the recorded ime.

This made Wilson an immense favorite nd he sold at $100 to $40 over the field.

In the second heat Mace sent Wilson way fast, reaching the half in the face he strong wind in 1:09, but Director was right there too, and in a vain effort to shake off the black bulldog, Mace drove Wilson to one of his peculiar breaks, a sort of leap with all four feet that never cost him any loss of position. Around the second turn Director out-trotted the favorite, carrying him to a tangled break, and Splan, who was trailing at the pole with Witherspoon, when he saw that Wilson was beaten called out; "Let me through, Dan," and Mace pulled out, letting Splan through at the pole and of course carrying Director out. With this advantage and Witherspoon on her good behavior Splan had no trouble in winning the fastest heat of the race.

After weighing in Goldsmith made a strong protest to the judges against the unfairness of Mace and Splan helping each other, but Mace simply said that when he could not win he thought it only fair to let some one through that could win. Goldsmith went out for the third heat thoroughly nettled at the combination, and I question if he ever got up in the sulky more determined to win if it was in his horse. In scoring he gave the black horse no rest and in getting away well at the word he was never really headed.

The talent were now all at sea. It did not seem possible that Director, single-handed, could defeat the combination, and but little Wilson money was "played off." A long time was spent in scoring for the fourth heat, each being anxious to secure an advantage, but each score found Goldsmith and Director up in place and at the eighth attempt the word was given. Again Director cut out the work and again he was first under the wire. It was plain now that Director had the race at his mercy unless some unforeseen contingency came up, and for the first time he sold a favorite.

The fifth and last heat was a fine exhibition. Wilson was plainly out of the race, but Splan had given Witherspoon an easy mile in the fourth heat and he came out for the fifth ready for one of his famous drives that have so often turned impending defeat into victory. Goldsmith realized the situation and the entire mile was a duel between these two master hands and their game, high-bred

Digitized by Google

horses. Director made a short break at the first turn, but he was back on his stride before Splan from the extreme outside could reach him, and from this point the little black horse kept his fleet competitor at his wheel. Even now I can see the grand struggle as if it had been trotted yesterday with each driver rallying his horse to the last stride, Splan sitting low in the sulky with head inclined to the right and the hands holding his flighty mare to her gait without, as it were, daring to move a muscle. It is a sight never to be forgotten to see Splan holding a nervous horse on tip-toes in one of his grand finishes, and I think that in this respect he excels any other trainer that ever sat in a sulky. Goldsmith drives a desperate finish in an exactly opposite manner. He sits erect with arms extended and the reins held high, and oh how he can hustle and arouse a tired horse! The man that can drive the last link out of a tired horse to excel John Goldsmith does not live.

The following year (1884) the association changed the stake from a 2:19 to a 2:20 class, and since then the conditions have remained unchanged. In that year the first money went to the noted campaigner Harry Wilkes, 2:13½. Seven starters appeared, but Harry ruled in the betting a favorite at 2 to 1 over the field, and he won easily after being "laid up" in the first heat, owing to a break just after getting the word. Andrew Jackson Feek had King Almont in the race and he had been figuring how to get second money, the other starters being Maud Messenger, 2:16¼; Captain Emmons, 2:19¼; Phil Thompson, 2:16½; Adelaide, 2:18, and Felix, 2:18¾. Several of these had more speed than Almont, but the final summary was in the order given above. When Feek saw Harry make a mistake he inferred that Van Ness would not make another drive for the heat and he never stopped driving King Almont until he had the heat won and second money virtually secure. The time of the heat, 2:21¼, just equaled Almont's record made in November of the year previous. That Feek was extremely fortunate in winning the heat is shown by the fact that Maud Messenger and Phil Thompson both had speed enough to force Harry to the half in the second heat in 1:06¾, but from there the little gelding jogged home in 2:17, and the race was all over but the formality of trotting two more heats.

What a wonderful campaigner Harry Wilkes proved. This was his first campaign as a prominent performer. I well recall his first appearance in the grand circuit. He then had a record of 2:23¼, and had been considered of but little account. Mr. W. C. France, then residing in New York, heard of the gelding during a visit to Kentucky, and he bought him, paying, if my memory is not at fault, about $3,500. He was placed in the hands of Frank Van Ness, and I saw him make his first start at the Pittsburgh meeting. My memory recalls that I classed the starters as a grand field of horses, among them Belle F., now with a record of 2:15¼; Mambrino Sparkle, 2:17, and several others that I saw win fame and money later on. Frank Van Ness and his pony proved quite a surprise at Pittsburgh, winning the race in straight heats all better than 2:20. From here he won everything before him, including the Charter Oak stake, until Providence was reached, when the big mare, Clemmie G., seemed able to take his measure. I had watched the little gelding win all of his races and had really come to believe him invincible, and when I saw George Saunders hold the big mare to her stride in a rattling finish and beat Harry with Van Ness using his whip, in 2:15½, I could scarcely believe that at last Harry was to be defeated. It was a great betting race, and Harry finally pulled it off, but the "nigger in the fence" kept the gossips busy for many a day, and the Boston race subsequently was a stench in the nostrils of the public. However, I am wandering from the Charter Oak stake series, and will leave Harry and his campaigns for a future reference.

The stake race of 1885 was a long-drawn-out affair, extending over two days and requiring seven heats. It had rained all of the preceding night and was cloudy and promised more rain all of the forenoon. When the sun came out, however, the track dried out quickly and in answer to the bell nine starters

Digitized by Google

peared. It was not a sensational field, betting was not heavy, and there was hing notable about the race except t it was a long one. The betting pub- estimated the chances of the starters follows: Joe Davis, $100; Adelaide,); Jerome Turner, $50; Felix, $40; nilworth, $40; Tucker, $20; Judge vis, $20; William Arthur, $20; Wind- M., $10. The scoring was very tedi- s in both the first and second heats, imes being anxious to get away with favorite, and Murphy being un- le to get up in his place with Kenil- rth. Joe Davis won both heats, second being a rattling finish tween he and Judge Davis and nilworth, only a head separating ch. A smart shower now broke over track and Joe Davis did not seem take kindly to the heavy footing, the sult being that Adelaide won the third at and Kenilworth the fourth, when rkness compelled a postponement.

The following day was all that could desired, and at 11:30 the horses were nt away for the fifth heat. Murphy ade a desperate drive and would have on the heat, but Felix reached the me stretch in the lead and Murphy und himself in a pocket. "Knap" as not inclined to let him through; in act he was inclined the other way, and fore Murphy could take his horse back nd go around Felix, Adelaide had lead nough to win the heat. Under the rules nly the heat winners could now start, nd Kenilworth won the sixth heat by onest trotting, carrying Joe Davis to a reak in the home stretch. This made Kenilworth a prime favorite and Murphy lt sure of capturing the stake, but in he seventh heat at the second turn Ken- lworth was seen to suddenly falter and top. Murphy started him again, but he pride of the Fleetwood contingent vas completely done and he hobbled home far behind the flag, Joe Davis beat- ing Adelaide and winning the race.

The race on September 2, 1886, was probably, all things considered, the most sensational in the series. The bay geld- ing, Oliver K. by King Wilkes, had been winning everything before him, and the Charter Oak stake was considered at his mercy. The field included Belle F., Prince Wilkes, Kenilworth and Bonnie McGregor aside from the favorite, and the general opinion of the capabilities of the contestants was shown in the betting, a sample pool being Oliver K., $500; Bonnie McGregor, $125, Kenilworth, $100; Belle F., $60; Prince Wilkes, $40.

George Forbes had brought out Oliver K. at Detroit, beating the combination that "Counsellor" Crawford, Orrin Hickok and the talent generally had made to win, and from that time down the line Oliver had not been beaten, his record being 2:16½, made in the fifth heat at Rochester, when he had beaten Belle Hamlin. Mr. Forbes was as shrewd a horseman as ever mounted a sulky, and he had sold Oliver at a long price to be delivered after the Hartford race, he reserving his winnings there. I had a long talk with Forbes before the race and found him very confident of winning. He seemed to rate Bonnie McGregor as the best of the field, but as Bonnie was known to have feet which hurt him when at speed and made him unsteady, Mr. Forbes did not display any anxiety.

In the first heat Oliver K. was "laid up" and Crit Davis did not move Prince Wilkes. In fact many asserted that both Forbes and Davis "laid up" so carefully that both were behind the distance flag through an error in judgment, but both were placed by the judges. Forbes had evidently driven an easy heat to give Budd Doble, who had negotiated the sale of Oliver K., a chance to win the heat with McGregor, and thus secure second money. The surprise came when the bay mare, Belle F., that after being "off" for a whole season had been purchased by Mr. E. C. Long, of Minneapolis, and placed in the hands of "Knap" McCarthy, outfinished both Bonnie McGregor and Kenilworth and won the heat in 2:15¾.

This clip made Mr. Forbes somewhat uneasy, and although Oliver still sold at even money against the field, his owner and driver knew the limit of his speed better than the public, and to be obliged to beat 2:16 was not a rosy prospect. Up to this time Forbes had kept the big gelding really under cover, in that too

Digitized by Google

had led the public to believe he was winning with a reserve of speed. I recall describing his heat in 2:16½ as being won in a big jog, and other turf writers credited the gelding with speed enough to trot in 2:12. All this helped to deceive the public. After the gelding had gone to his new owner, and his weak leg became so bad that he had to be thrown out out of training, Forbes made no secret to me of the fact that when I and others thought he was winning easily, he was really driving the gelding to his limit. "It looked to you like he was winning easy," said Forbes, "but the truth is I was generally fishing him lightly, just enough to keep him all out."

But to go back to the second heat of the big race. Forbes knew that Belle was not only dangerous, but that if she came back two heats more at the same clip she was liable to beat him, and he started out fully prepared for a desperate struggle. At the word he sent Oliver fast from the outside, and lapping Belle and Bonnie McGregor at the turn, the three passed the quarter pole in 34 seconds. Up the back stretch Oliver and Bonnie passed Belle, trotting the second quarter in 33½ seconds. Around the second turn Oliver made a break, losing two lengths, leaving him in third position, but after recovering his stride he came fast, and half way down the homestretch carried Bonnie to a break and reached Belle F. No one present will ever forget the finishing struggle. Forbes realized that the heat would probably decide the race, and for the first time in all his races Oliver felt the sharp sting of the whip. McCarthy, too, was driving with desperation, and as the pair neared the wire 10,000 spectators scarcely breathed, so intense was the excitement. In the last stride McCarthy lifted his mare, and, believing he had won, he turned and laughed at Forbes. The finish was so close that no outsider cared to express an opinion, but the judges said, "Belle F., 2:15¼," and an instantaneous photograph showed that the mare had won by a short head.

This made Belle a favorite, and it really looked as if she could defeat the big gelding. Many thought McCarthy would now "lay up" his mare, as she had two heats won, but "Knap" started out to win the third heat, and Forbes was equally determined to gather it in with Oliver. Up to the homestretch neither had any advantage, but the two hard heats had made Belle leg weary, and she went to a tired break and fell out of the fight. Even then Forbes found no rest, for Crit Davis, after finishing last in each preceding heat with Prince Wilkes, had started to make his drive. No sooner had Belle dropped back than Forbes found the Prince at his wheel, and again the spectators were treated to a whipping finish, Oliver just getting the heat in 2:16¼, his present record. The fourth heat was another fight to a finish between Oliver and Prince, the former being obliged to duplicate his record to win, and the fifth heat was a repetition, except that the time was a trifle slower. At that time the race stood as the fastest five-heat one on record.

The race of 1887 was really devoid of interest, except for the pleasure the public found in seeing a noted horse perform. Patron was the reigning star that season and he had vanquished all competitors, including the heretofore invincible Harry Wilkes. When it was known that he was named for the stake all speculation as to the winner ceased. The crowd present was the largest in my opinion that ever gathered within the historic park and I well remember being unable to secure a room at any hotel and was forced, with many others, to pass a sleepless night preceding the race. There were six starters: Prince Wilkes, Loretta F., Astral, Mystie and Dan composing the field the favorite had to beat. Prince Wilkes was the only one that could make a show of a race with Patron, and it was Fuller's intention to give the spectators the pleasure of seeing a fast heat. After jogging two winning heats in 2:17¾, 2:17, it was the idea to drive the third in about 2:12, but a heavy shower came up and made the track very muddy. As a fast mile was now impossible Fuller jogged Patron to the half in 1:11 and then moved him home in 1:07, the third quarter being trotted according to outside watches, in thirty-two seconds, and this in the mud.

Digitized by Google

race of 1888 went to the credit Kentucky Prince family, although he original favorite, was not "in ter the first score. Before the e little black whirlwind sold in tting at nearly even money over d, the other starters being Spof- Kit Curry, T. T. S., White Stock- Thornless and Pilot Knox. Had rd been given on the first score ight have won the race, but after g steady once he refused to strike and was finally sent away on a and declared distanced, for he e entire mile. Spofford, a steady- sensible son of the same sire, won at and race, which with Guy out me.

greatest upset in the history of ake was when Alcryon defeated on August 28, 1889. I need not upon any of the gossip regarding job" that fell through, because the rom Maine did not keep his agree- for the public have had enough h Nelson and Noble and accom- ng scandal. The facts are that elson party threw away the race, Noble is always ready to find first y when it is $5,000. In the betting e the start Nelson was the hottest of a favorite, selling at $500—as s buyers could be found for the field 50. This field comprised Alcryon, va S., Jack, Sensation, Persica and light. The race promised to be a ght-heat affair and no man on the nds felt more confident of success the man from Maine. How true e old saying, "It takes more brains tand prosperity than adversity." Mr. Nelson and Woodbury, his er, gone into the race cautious and aying good judgment, Nelson could won easily. When he had the first well in hand and could have won out being extended, Woodbury drove to get a record, and this really cost the race. It is a common practice rive out the last heat of a race for a record, but I have never before or e seen a man select the first heat for cord effort. Nelson trotted the heat :14¼, when he could have won in seconds slower time, and the result at in the second heat when Alcryon reached him in the homestretch and both trainers drew the whip, Nelson swerved and gave evidence of distress and exhaustion, while Alcryon came away from every stroke and won by nearly a length.

This heat demonstrated the lack of judgment in both owner and trainer, especially the former. He of all others should have known that his horse was not a bull dog, either by breeding or inclination, and that while with his great speed he might win races in fast time if nursed, and his strength husbanded he could never hope to beat a good game horse when it came to a struggle of endurance.

When it was seen that Nelson was done, and that Alcryon in beating the favorite had also become weary, a strong tip prevailed that Doble could win with Jack. The fast son of Pilot Medium did not justify the expectations of his friends, for although he forced Robens to use his whip in the finish of the third heat, he was easily beaten in the fourth by Alcryon in 2:19½. The sequel to this race, the Balch stallion race, need only be referred to here, as it has long since become nauseating to the public. Had Nelson (the man) possessed the brains to win the Charter Oak stake it is not probable that the Balch race scandal would ever have been evolved.

"The cheapest big race on record" was what I termed the Charter Oak stake race of 1890, and I have never seen any reason to change my views. It gave promise of being the most sensational race in the history of the stake. Prince Regent had acquired a record of 2:16½ in his winning race at Buffalo, and a week later his most formidable competitor, Pamlico, had put his record at 2:16¾, also in a winning race. Among the other nominations to the stake was Edith R., with a record of 2:17¼, made also but a few weeks previous, and Fearnaught, Siglight and Betty Jones. For several weeks before the race, speculation as to the result was rife. "I will bet $1,000 to $500 that Prince Regent wins the race," said C. J. Hamlin at the Poughkeepsie meeting which preceded Hartford. When I repeated this to James Goldsmith, the trainer of Pam-

Digitized by Google

lico, he assured me that it was not such odds that Regent would win. "My horse was never in better form," he added, "and Regent will have to trot a faster race than he has ever done to win."

The final facts of the race are so recent as to be still fresh in the minds of all readers. Prince Regent was "all off" and so were the others, and not a heat in the race was trotted as fast as 2:19. Of course there was the inevitable gossip when Pamlico could not beat 2:20. I never gave credence to the gossip, but I do know that after Edith R. won the second heat her party went to Mr. Goldsmith and offered to make a combination to defeat Prince Regent and divide equally the winnings of Edith R. and Pamlico, but Mr. Goldsmith declined the proposition.

The race of 1891 is of such recent occurrence as to call for but brief mention here. It was the longest and hardest-fought important race on record. Nine heats in all were trotted before a decision was reached. Eleven nominators had made the last payment, but only seven starters appeared to contest for the money. The betting was heavy, as each favorite had plenty of support and all had shown enough during the season to warrant it. Little Albert sold favorite at $300; Nightingale, $150; Abbie V., $100; Miss Alice, $50; Prodigal, $25, and Bellman and Frank F. at $10 each. Miss Alice won the first heat, but became unsteady later on, owing to her lack of condition, and Abbie V. won the second and third heats, and she then sold at $100 to $50 over the field. Little Albert, the original favorite acted sore and it was evident his hard race at Springfield the week previous had dulled his fine edge. The dead heat between Albert and Nightingale has always been a bone of contention. Andrews, the driver of Albert, was sure he had won, and many spectators took the same view. The local photographer took an instantaneous picture of the finish of the heat, and I was promised one for publication but I could never get it, and I was informed the plate did not develop sufficiently to make a clear print. The judges decided it a dead heat, and it really gave Nightingale the race eventually, as after she and Albert had each won two heats and Abbie V. had been ruled out, the weak leg that had bothered Albert gave way entirely and Nightingale virtually walked home in the deciding heat.

After winning the large juicy plum two years in succession, it was only natural that Mr. Hamlin should covet it again this year, and he named as his standard bearer the bay gelding Globe, that, although his harness record was 2:19¼, had trotted to the pole with Belle Hamlin in 2:12. The other starters numbered thirteen, making it the largest field that ever scored for the stake. Belle Vara was made the favorite in the betting, as she had shown speed enough so far to defeat all competitors. Globe drew the pole, which was a great advantage in so large a field, and when the big gelding gathered in the first heat in 2:14¾ it looked like Village Farm had a mortgage on the stake. The capabilities of one starter, however, had been an unknown quantity, and when the black mare Nightingale, by Osgood's Patchen, was "turned loose" she gave Globe a hard race and won the third, fourth and fifth heats and race. The time was phenomenal, every heat being better than 2:15. While it stands as the best on record for the stake, I question if it was really as fast a race, all things considered, as the race of 1886. It has been demonstrated that the bicycle sulky is from two to four seconds faster than the former regulation style. With this fact before us the race of 1892 becomes at least second in point of speed as is shown by the following: The four heats of the race in 1886 were trotted in 2:15, 2:15¼, 2:16¼, 2:16¼, and the four heats in 1892, 2:14¾, 2:13½, 2:14¼, 2:14, which leads me to ask: Are not the great reductions in the trotting record due more to the improvements made in track, sulkies and the many accessories rather than in the actual speed of the trotters as compared with noted predecessors.

PROBLEMS IN FARRIERY.

BY S. T. H.

Merits of the Hind Shoe with the Extended Outward Curving Outside Heel.

WITHIN the entire range of fancy far-ery there has never been devised a orseshoe that has been so generally opted as this odd-shaped pattern. ere is probably no horse owner within wide radius of the large cities of Amer-, whose roadster can speed a four-min-e gait; no landau team that have the sired high-stepping action; no horse in ining for trotting speed, be his prom-great or small, but that their hind t have been shod with this now uni-rsally favorite form of armature, which supposed to add capacity for action yond the promise of each individual information. Its shape varies in ac-dance with the peculiar objects sought be attained. Sometimes one side is avier than the other. Quite often one e, generally the outer branch, is wider n the other. Frequently both heels provided with oblong heel calkins, t more generally the outside is thus nished, while the inside heel is edged to the same thickness without calkin. But in all cases the decided cacy of the shoe is supposed to be centrated in the projected, outward ving posterior branch of the outside l. The more excessive are both the ngation and the curve, the more effect-is claimed to be this form of the hind e. The writer recently entered a ithy where all classes of elegant ness horses are shod, and, from mass of cast-off hind shoes, selected lighter specimens, whose tracings presented for illustrations as figures and 2 of this paper. More than one-f of the worn-out hind shoes in this ensive shop had been wrought into popular pattern. On the race courses average is so much greater that it is exception to find a speedy trotter shod h plain, neatly fitting hind shoes, that ctly follow the outer margin of the l, and end with the curvature of the ls. While nearly all of them are shod in in front, with the web broad to pre-t sinking into the ground, and as t as possible to still further reduce friction and exhaustion, their hind t were almost universally armed with this peculiarly odd-shaped, unbalanced shoe, unknown in farriery prior to the past decade, with the outside branch extending from a quarter to a full inch and more beyond the heel of the foot, and terminating in an outward curvature, more or less violent, depending upon the fancy of the owner, or the extravagant pride of the smith in his workmanship. It is a forcible illustration of a sweeping fashion, a veritable rage in American farriery. Strange to add, very few of its advocates among owners and shoers attempt to give an intelligent reason for its universal adoption. The very appearance of the shoe gives the impression that it must be the embodiment of mysterious wisdom. The projecting outside curve gives it the impress of scientific construction when compared with the ordinary, plain hind shoe. The veteran as well as the amateur horseman has accepted the general conclusion, without subjecting it to careful investigation from its striking formation, that its operation must be both positive and instantaneous in widening and balancing the trotting action. The proof of this inference is the universality of its adoption, and yet this very popularity, upon searching inquiry, is plainly the result of blind imitation without investigation into its mechanical operation or its physiological effects, upon the part of its advocates.

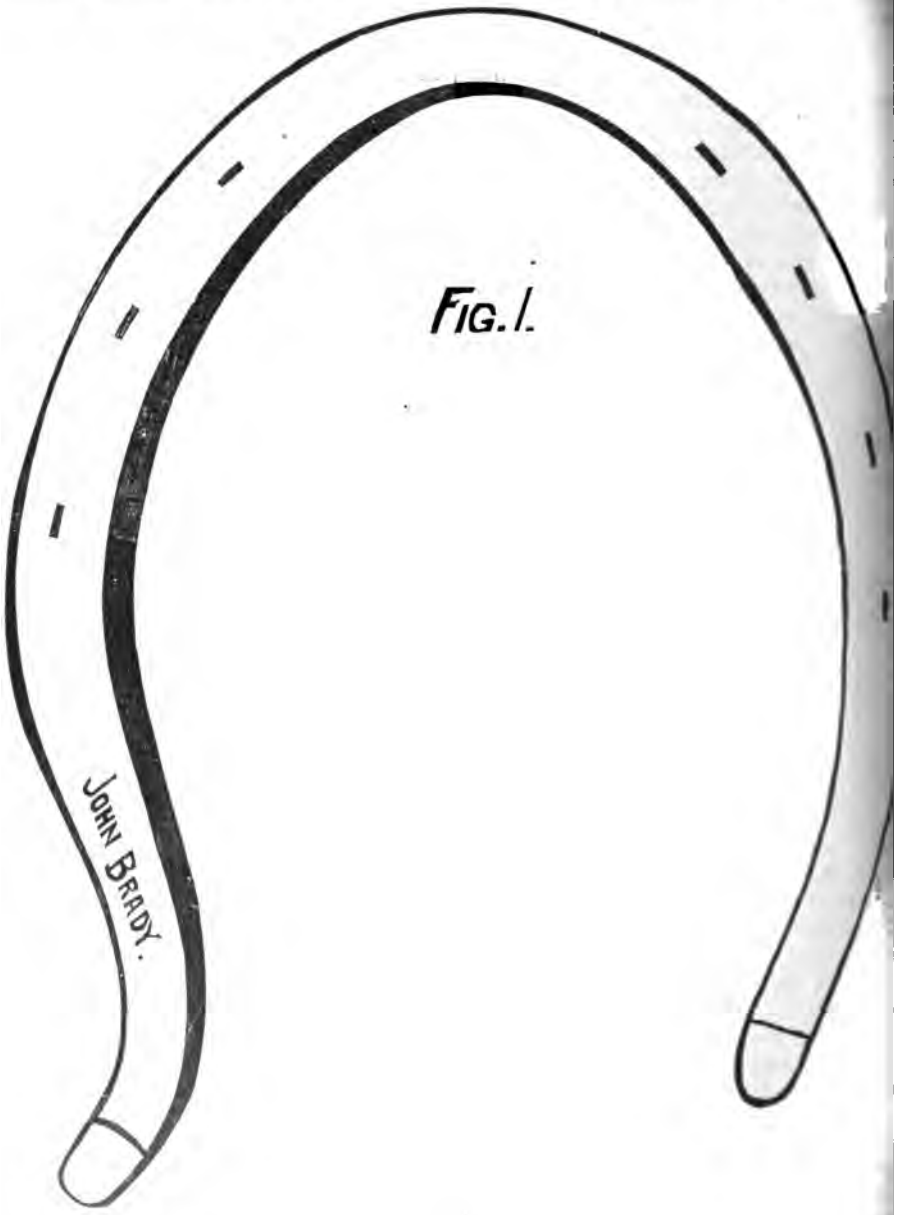
The first horseman, whose hair has grown white and thin by streaming in the wind these many years behind his flying champions, the writer interviewed on this shoe, was the venerable Uncle Jack Hook, the driver of Dr. Sparks.

"Why do you have the outside heel of the hind shoe project beyond the heel of the hoof and turn out?" "Well really," he responded, "I can not answer better than to say that it is the general opinion it balances the action better." Then followed the interrogatory:

"In what way? What deficiency was there in the stride of Dr. Sparks, for instance, that this shoe corrected?" "He had no deficiency," he replied, "*the fact is I put them on him because nearly every other horse* has them on." Ninety

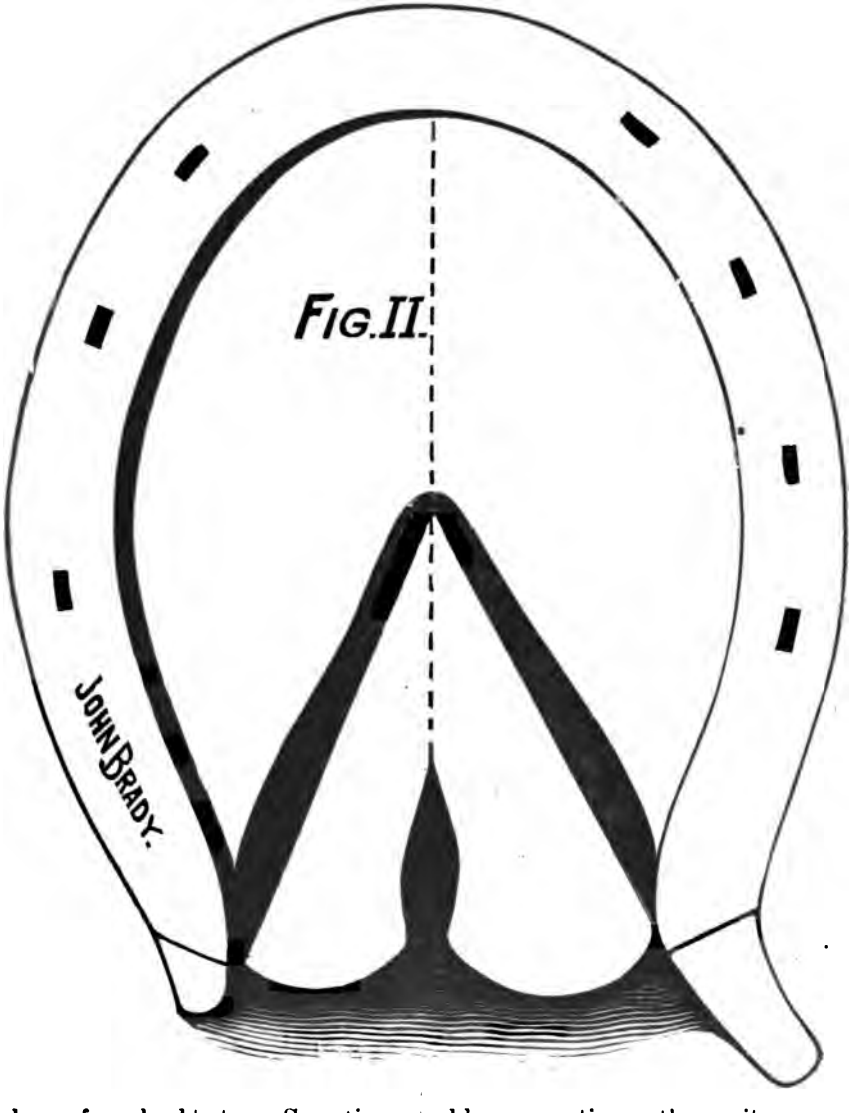
Digitized by Google

and nine out of every one hundred horsemen would give substantially the same answer. No matter whether the horse is heavy bodied on short limbs, or the reverse; whether lengthy in the carcass or compact; whether high or low gaited, the same pattern of shoe is almost invariably found on his hind feet, while the front shoe will vary widely in form and furnishings. It is generally made the web of the outside branch wide the inside half, which latter follow foot and curves neatly with the heel, being swedged as thick at the as the shoe and calkin combined, s to make both the posterior branche the same thickness. The intentio making both heels of the same thick



Digitized by Google

is to level up the heels so that they will strike the ground at once, on the same plane, but obviously this design is defeated, precisely by the degree of excess of the prolongation of the outside heel. Sometimes the outside calkin is not added, so that the web of the shoe is uniform



a thickness from heel to toe. Sometimes the shoe is exceedingly light, varying in weight from three to seven ounces, and, in other instances the outside branch is made so heavy and full at the forward arch of the toe that the weight will reach ten or twelve ounces. But the projection of the outside heel, always terminating in a curve, is supposed to be the most effective portion in improving the action.

After seeking information from a leading farrier on the ground, whose work on scientific horse-shoeing is full of valuable suggestions, the writer was able to summarize from all sources the supposed benefits of this shoe under the following enumerations:

1. This pattern is made broader and longer on the outside, to provide for the alleged extra bearing and pressure on

Digitized by Google

the outside branch of the hoof. It is claimed that the preponderance of weight is always concentrated on the outside half of the foot. As a physiological proposition it is untrue. The preponderance of weight depends entirely upon the shape and position of the hoof.

If the inside branch is left higher than the outside, then the excess of pressure is on the inside. Whichever side is higher receives the primary concussion and consequently endures the greater friction, which invariably promotes an abnormal growth on the elevated side. Independently of this mechanical cause, some feet grow faster on one side than on the other, and, to preserve a level bearing, it is necessary to pare the side that grows with the greater rapidity, much more severely than the other.

But when the foot is dressed to an exact level and properly balanced and both heels are shod with the branches of a shoe of the same height, there is no excess of bearing on the outside. The reason is obvious upon reflection. When the foot is level and balanced, *the weight descends through the axes of the bones of the limbs and the center of the joints to the foot.* If there was more pressure on the outside branch of the foot this center line of concussion would be disturbed, by being thrown further over toward the outside and thus destroy the exact resolution of forces, and the accurate distribution of weight between the bones and the tendons which the equipoise of the level and balanced foot and limb alone insure.

The demonstration of the accuracy of this conclusion is furnished by the footprints, upon a planed surface of ground, which are rarely noted and considered by either owner, or farrier, in their studies of the effects of mechanical appliances on the feet. When the heels are of the same height, the horse lands true and square provided the branches of the shoe are of precisely equal length and thickness, with manifestly equal pressure upon both heels. The foot then revolves over level quarters, thereby distributing the weight equally upon them, and springs from a toe that is precisely equi-distant, and pivotal between the quarters. It is, therefore, a mechanical impossibility for a preponderance of pressure to be concentrated on the outside branch of the hoof. When the footprints of a hind foot, thus prepared, are examined, the impression of the inside branch is clearly as deep and well outlined as that of the outside branch. So far, therefore, as relates to pressure the extended outside heel, and the full outside margin of this peculiar shoe is not demanded by either the physiology or the mechanical action of the hind limb and foot.

II. "But," said the thoughtful farrier. when this use of the projecting hind shoe was shown to be untenable, "it "certainly widens the hind action, and "thereby prevents both forging, speedy "cutting, and cross-firing, produced by "sending one hind foot up, in between "the two front feet."

When asked to explain how the long outside heel and the wider outside web could perceptibly widen the action behind, he again referred to the supposed greater outside pressure thus produced, and could muster no other explanation although the wear of the shoe reveals an equal pressure on both branches. Just then a noted horse, thus shod, passed on the smooth course, trotting a twenty gait, and the footprints were closely observed. His trouble has always been that, like that of the gallant trotting gelding Jack, his hind action has been claimed to be too close, and many expedients have been adopted to widen it, but nothing has been tried, which, to the owner's conviction, has been so effectual as the extended outward curving, long heel, on the outside branch of the foot.

When the footprints were noted for several successive strides, the assembled horsemen were dismayed to discover *that the hind footprints invariably occurred inside and not outside of the front ones, though on a line with them.* The horse trotted like a dog, with both hind footprints between the front ones. The long, outside heel did not in the least widen the hind action. The mechanical effects of this peculiar construction upon the foot articulation have never been thoroughly analyzed. When the uplifted hind foot is projected forward, the long heel must necessarily land first. The deeper imprint of the

Digitized by Google

outside heel of the shoe proves this assertion. The normal action of the foot articulation is for both heels to land at once. When the outside heel is thus forced to land first, it not only receives all the primary concussion, instead of equally dividing it with the inside heel, *but the foot careens over toward the inside heel to give it a bearing, and this unnatural inclination necessarily throws the toe outward, so that when the foot revolves over the quarters to rise upon the toe the entire foot is directed outwardly, and the spring into the air is in that outwardly direction. But the footprint, when the hind foot lands, is not thus outwardly pointed.* This complication presents an inextricable puzzle to farriers who vainly conclude that mechanical appliances uniformly override physiological construction. The footprint is invariably in a straight line if the ankle and stifle so articulate, and it is otherwise if they observe a different angle. Farriers must be taught to know that, without any possible deviation, the landing of the hind foot upon the ground, is unalterably governed by the inclination of the stifle, which not only influences the inclination in the movement of the hock, but of the ankle, in the final placing of the foot. If the anterior point of the stifle turns inwardly, the hocks will necessarily stand wide apart and the hind feet will toe inwardly. This conformation produces cross-firing or sending generally one hind foot up in between the front feet. But if the stifles turn outwardly the hocks must come close together and the feet toe outwardly. The uplifting of the toes turning inwardly prevents interference with both tendons, ankles and knees, just as the rising of the toes turning outwardly incline in the air just as far inwardly as they stand outwardly while on the ground, and this action causes the interferences above described. But when the foot lands, no matter how much its position may be changed by this mechanical device of a long outside heel on the shoe, its position upon the ground is determined absolutely by the anterior point of the stifle. If the stifle is straight the footprint of a level-balanced foot will be straight and in line with the articulation of the stifle. If the anterior point of the stifle turns outwardly, so will the hind foot point outwardly. If the stifle turns inwardly, so will the hind foot turn inwardly when it reaches its altitude for the forward extension, despite the outside branch of the hind shoe, no matter how indefinitely long it may be projected. The serious error that farriers make is the failure to comprehend that there are only four motions in the joint economy of the horse: (a) Either gliding, that is, one bone sliding upon another, such as the sesamoids; (b) angular—backward and forward on one plane, such as the elbow and the hock; (c) rotary—of a bone upon its axis, such as is only seen in the horse, in the joint between the first two vertabræ of the neck; (d) and circumducing, such as is exemplified in the ball-and-socket joints of the shoulder and hip. The set of the stifle, therefore, controls the circumducing compensations of the hip. If the toe is forced to turn outwardly by mechanical contrivances, the controlling effect of the stifle, made absolute by the revolving ball-and-socket joint of the hip above, overcomes all such mechanical interferences after the hind foot leaves the ground and causes it to land, as if there were no such interferences *in the line of the articulation of the stifle.* If this position is physiologically correct, all attempts to widen the action, either by the long outside heel or the raised inside forward arch of the web of the shoe, are utterly futile. The only practical method of regulating and adjusting the hind stride, to bring it into harmony with the forward one, is either to retard the one and quicken the other, or to elevate the one and lower the other, which can be done by dressing the two pairs of feet and properly shoeing them with reference to controlling the length, elevation and rapidity of these respective strides. But it may be said, if the set of the stifle makes the hind feet pigeon-toed or splay-footed, the former will promote a higher inside half of the foot and the latter a higher outside branch. This is the actual result and correctly explains why one side so often grows more rapidly than the other. When the inclination of the stifle thus deviates from a straight line it is a physiological

Digitized by Google

defect. In the future, when a more accurate science is applied to breeding the trotting horse than merely the intensification of his trotting blood, and physiological perfection receives its adequate attention, defective construction of shoulder and hip, of elbow and stifle, will be so far remedied by judicious crossing of perfect specimens that there will be neither splay-footed nor pigeon-toed performers on the trotting turf. Physiologically, much more than in trotting potency, the perfect American trotter is in the distant future as a type.

Moreover, in this connection, the reflection is pertinent that the shape, weight and position of the head and neck, with reference to the length and elevation of the front and hind strides has not been sufficiently appreciated. Reference is made for illustration, to the experiments of Mons. Bouchèr, probably the most original and profound of modern French hippopathologists. He placed a hack mare, with her fore and hind legs on separate weighing machines. When left to assume the natural elevation of her head and neck, she weighed fore-handed 210 kilogrammes, and behind 174 kilogrammes. Her total weight on a single scale was 384 kilogrammes. It approximates near enough to accuracy for our purpose to add that a French kilogramme is about equal to two and one-fifth pounds avoirdupois weight. Now mark the value of his subsequent experiments in their relation to the complicated subject of balancing the American trotter, of which the able French veterinary surgeon never dreamed.

By depressing the head, so as to bring the nose to a level with the chest, eight kilogrammes were transferred from the hind to the front scales. When the head and neck were elevated to the height of the withers ten kilogrammes were transferred from the front to the hind scales, and eight additional kilogrammes were thus transferred from the front limbs to the hind ones, making a change of eighteen in all, or nearly forty pounds, by raising the head and neck by means of the ordinary side check. If he had been possessed of an American overdraw check he could easily have increased the transfer from the front to the hind parts, or vice versa, with the standing martingale, to at least sixty pounds. Thus by using the leverage of the head and neck, one fourteenth of the entire weight of the horse can be transferred at will, either to the front or hind limbs. The power thus afforded to bring into equilibrium the front and hind strides is so incalcuable that the petty contrivance of the outward curving branch of the extended outside heel under consideration is indescribably ineffectual. The older trotting horse trainers were aware that each horse in their charge trotted the best when the check rein was drawn to a certain hole, but they did not understand why the changing of the rein demoralized his speed, because they had not mastered the philosophy of balanced action. Thus physiology and empiricism indicate to the farrier and the trainer that their studies should be directed toward balancing the action of the trotting horse, in the line of the articulation of the elbow in front and the stifle behind, and not by attempting mechanical violence to the peculiarities of their structures. All such appliances including every means to change the natural direction of a leveled, balanced foot, such as transverse toe calkins, to pitch the toe either outwardly or inwardly; side weights, to unduly tax the muscles on the outside of the limb, in opposition to the line of articulation of the joints; and the projected long outside heel calkin, to widen the action contrary to the inclination of his entire hind construction must not only ultimate in his injury, but in disappointment to the experimenter. But this line of investigation merely comprehends the failure of desired change with reference to the forced direction in the foot articulation. The effects upon the ankle and coffin joints must be exceedingly violent. The careening of the ankle over from the long heel to reach the short heel is an actual twisting of the heads of the bones in their sockets, which strain comes upon the ligaments that hold them in their position, somewhat less, it may be, than a wrench, that in most instances excites active inflammation, but severe enough to cause positive discomfort, as it constantly opposes the normal func-

Digitized by Google

tions of all these locomotive agents. When these conditions exist it is a physiological impossibility for the long-heeled shoe, either to widen the action or to assist the joints and bones and tendons and ligaments to produce a speedier trotting action.

III. But, probably the more intelligent farriers insist that the main use of this outside heel extension is to brace up the ankle when it naturally leans over to the outside, giving the hind limbs the appearance of being decidedly bow-legged. Various causes may produce this bending over of the hind ankle, which the average horseman has been taught to ascribe to the excess of pressure on the outside branch of the shoe. This alleged condition he concludes necessitates both the long heel, and the wide web, on the outside branch to prevent the outer half of the foot from unduly sinking into the ground. This undue sinking, where there is neither deformity nor weakness, he further claims, bends the ankle over, and hence the benefit of these outside braces.

The remedy is infinitely more omnipresent than either the existence of this alleged preponderance of pressure or resultant natural deformity. The ankle may bend too far under, when like that of the old-time pacer it is sickle in shape. It may be too upright in position, when the pastern is too short, and the points of the hips are on a line, or even back of the coupling. The former may produce weak tendons, and the latter, knuckled ankles. But very rarely, do the ankles assume the chronic deformity if bending either inwardly or outwardly. As well might the claim be made that the human ankle bends outwardly and becomes thus deformed, when, in fact it is a model of equipoise.

This alleged careening of the hind ankle, when in rare instances it does occur, when it is so positive that even the ball-and-socket joint compensation of the hip can not correct the malformation, is generally due to easily diagnosed causes. It may arise from weakness above the ankle, especially from spavin, as in the case of the famous Ethan Allen. He was spavined in both hind legs, and the pain caused him to throw the pressure on the outside of the hind limbs. It was said of him that the bowed hind legs prevented the necessity of spreading behind, but his footprints showed he trotted exactly in his tracks.

When the spavins from severe work produce painful inflammation, the horse, to relieve the pressure upon the spavin points, may bend the ankle over to the outside, thus shifting the weight and concussion, as far as possible, upon the outer, sounder portions of the limb, but that does not cause a weakness of the ankle. Indeed if the ankle is forced to its normal position, severe pain above results. Then, again, it may arise from defects below the ankle. If the coronet is raised at its inner half by either inherited or accidental causes, attended with an ossified cartilege on the inside branch of the hoof, the horse to ease the pain will bend the ankle over to the outside. But both of these instances are rare. Not one in a thousand horses thus shod are afflicted either above or below the ankle. If there is any bending over of the ankle it is generally due to an uneven wall. When the wall on the inside branch of the hoof is higher, that mechanical advantage will force the ankle over to the outside. The palpable remedy is to dress the foot to a perfect level, and then the ankle will resume its correct position without the interposition of any mechanical contrivance, be it awkward, like this ungainly shoe, or severe like the destructive side weights.

But the inquiry that now arises, "Does this shoe brace and straighten "up the weak or deformed ankle, thus "leaning over to the outside?" demands exhaustive consideration. The best test is the wear of the cast-off shoe. It is generally conceded that the outside wears faster than the inside, but repeated experiments where the wall is kept perfectly level and the hoof exactly balanced prove that the excess of wear is confined to the toe. The heels of the shoe that exactly fit the hind hoof will wear away evenly when the foot is straight, but not to the extent of the toe. If the foot toes out the wear will be greater toward the inside section of the toe, and then the inside heel will wear away faster than the outside heel. If it

Digitized by Google

points inwardly then the reverse will occur. But if the foot is straight, the wear will be directly at the toe, and evenly balanced but lessening toward the heels. The correct straight foot, therefore, needs no one-sided bracing of the ankle. *Its greatest strength is derived from its articulation in its correct position, which insures even pressure.* When the horse shod with the long outside heel is speeded the outside projection on reaching the ground, glides forward, unassisted, thus making the ankle sustain this one-sided pressure for a perceptible space before the imprint of the shoe becomes fixed. Instead of being a brace, therefore, it must be a strain, for its long leverage must exert a tremendous power confined entirely to one side. In several instances this ungainly shoe has been removed, or both heels have been extended when the hind action was to be shortened, and, without a single exception, the ankle was not only thereby relieved from strain but the action was more perfectly balanced.

These are said to be the main functions of the long, outside heel. But there are several alleged minor benefits that require attention.

III. The transverse hook of the long outside heel, it is claimed, will prevent slipping after the foot lands upon the ground. The statement seems to be plausible, but actual experiment does not confirm its accuracy. The footprints show that the long heel actually skates before the foot finds a firm landing upon the ground. The check of the heels of the unshod hoof is based upon a much more complete principle. The inflection of the wall at the heel, forming the angle of the bar is the check which nature provides for preventing slipping. The calkin in any form is an indifferent substitute for nature's provision, even when they are welded on both heels of the shoe; but if only one heel touches the ground, obviously the checking is altogether one-sided, and, therefore, more liable to twist the foot at the pivotal calkin than to hold it firmly upon the ground.

IV. Yet the advocates of this shoe insist that this long-heeled, transverse calkin not only prevents slipping, *but the peculiar grinding of the hind foot upon the ground, which attends the articulation of some hind feet.*

If occular demonstration was conclusive in the affirmative of this position, its advocates would not need any further justification, but when such proof is in every instance painfully lacking, the remedial value of the shoe in this regard is absolutely worthless. Once a grinder always a grinder. Like stringhalt it is incurable. The writer has tried a sufficient number of experiments with horses that grind their hind feet upon the ground, armed with the long outside heel calkins, to assert positively that in no single instance has the grinding been perceptibly diminished.

Before this or any other mechanical remedy should be generally adopted, it would be more philosophical to ascertain the cause of grinding. Like stringhalt and cocked ankles, grinding is not only confined to the hind limbs and feet, but entirely among four-footed animals to the horse. Sometimes the heel grinds outwardly and in other instances inwardly. No matter what pattern of shoe is used, whether plain or concave on the ground surface, or the ordinary heel and toe-turned-up calkins, or the four oblong calkined shoe, the grinding goes on persistently at every footfall. When it is remembered that the movement of all the joints from the foot to the hip is almost rigidly that of flexion and extension, backward and forward; on the same plane, it is a physiological certainty that the grinding is not produced by either the joints of the feet and limbs, or by the muscles of locomotion, or their tedonous prolongations.

What else, then, the intelligent reader may enquire, can possibly produce this peculiar grinding movement? *It will be noted by the careful observer that the grinding does not take place when the foot lands upon the ground, but only when the heel is in the act of being almost imperceptibly raised for the uplifting of the foot upon the toe for the next step.* The grinding, therefore, is performed through the agency of some of the ligaments that are not powerful enough to act in opposition to the flexor and extensor tendons. Moreover the

Digitized by Google

former must act when the latter are in only comparatively passive operation. This agency must be confined to some of the lateral ligaments. It can not be traced to the suspensory ligament, for after that splits into two strong bands it becomes continuous with the extensor tendon, located entirely in front of the limb. Nor can this grinding be located in any of the laterial ligaments above the ankle, either the superficial or deep seated, for their operation is confined to holding the limb and joints above the ankle in position, while the flexor and extensor tendous are locomoting the limb. The only ones that could thus grind the posterior portions of the hoof upon the toe, as the pivotal point, must be the two lateral ligaments of the pastern joint. They are not only thick, dense and powerful, but they pursue an oblique direction, from above downward, and from the front backward, on each side of the joint. They arise from two depressions, on the sides of the pastern bones, and terminate at the upper edge of the coronal bones. But their lowest fibres prolong themselves beyond the coronet bone to the extremities of the navicular bone, and thereby constitute the posterior lateral ligaments of the coffin joint. Their strength, location and operation, therefore, is to keep the foot in position, with reference to the pastern. If either one of these lateral ligaments of the pastern and coffin joints becomes contracted, the heel of the foot will be drawn toward the contracted ligament. This would be sufficient cause to produce grinding. If the outside ligament is constricted, the heel will be drawn outwardly in the grinding movement. If the inside ligament is shortened, then the heel will be drawn to the inside.

The writer was led to this train of investigation by the grinding of his colt's hind foot. This movement did not occur till the inside branch of his off hind foot had been afflicted with quittor.

The sinuses were deep and far reaching. They affected the inside lateral ligament of the coffin joint, and perceptibly shortened it, as was evidenced by the carrying of the heel in grinding towa l the other limb and hoof. When the quittor healed, and not before, the grinding began. It never increases or diminishes. The contraction of the lateral ligament of the coffin bone has become permanently established. This limits the degree of the grinding movement. All the methods known to farriery have been used to prevent it, but absolutely in vain. The reason of this impotancy is obvious to any one who has followed this diagnosis. The contracted lateral ligament of the coffin joint does not operate effectively till the flexor tendon is comparatively passive yet powerful enough in its incipient inflexion to raise the heel slightly from the ground. The contracted lateral ligament then instantly draws the heel to its side, while the toe operates as the pivotal point to enable it the more easily to accomplish its purpose.

All the calkins, therefore, that can be devised; whether at the heels, sides or toes; or whether straight or projected outwardly only on the outside heel, as in the pattern of shoe under consideration, will prove to be ineffectual, simply because the cause of the movement has become organic, and the time of its operation is when the calkins can not oppose any basic resistance.

But its advocates insist, further, that the long leverage of the projected outside heel calkin more effectually breaks the concussion, when the foot is either heel or toe sore, and perceptibly relieves the afflicted part. Any soreness within the hard hoof is imprisoned inflammation. It should be reduced and drawn out by medical agencies, not by iron or steel shoes. If the horse is sore in the heels he will make a desperate attempt to land either flat footed or upon the toe. This is the plain movement of the horse afflicted with navicular disease. If he is sore in the toe he will strike harder upon the heel. This is manifest when the foot, suffering from laminitis, plants the heel so firmly upon the ground that, on going up a grade, the lameness is more painful, because the toe comes first in contact with the ground. When the heel grows too high, inflicting heel bruises, or the toe too long, producing bruises around the forward arch of the sole, the remedial treatment is neither

Digitized by Google

long heels nor short ones in any of these cases, but obviously, such a scientific dressing of the foot as will bring the length of the toe and height of the heel into their normal relationship. To claim that any form of shoe will be effective is ignorance as dense as it is impotent. Nature has made the heels equidistant from the extreme toe. Any device that disturbs this arrangement plainly disarranges the exact precision of the foot articulation. Undue length of heels is equivalent to undue height of heel in mechanical effect. Undue length of one heel is equivalent to undue height of that heel, and operates precisely as if that heel was dressed to a higher plane than the other. There are cases in which the heels of the shoe should be projected beyond the heels, obviously, when the foot grows rapidly at the toe and sluggishly at the heel, thereby leaving them abnormally low, and producing various forms of interference in action. But, as a general rule, the heels of the shoe should terminate with the heels of the foot, neatly and precisely, leaving the farrier to dress the foot to the proper level and balance, with reference to the correct length of toe and height of heel Then the weight descends normally through the axes of the bones and joints inflicting the least possible resultant concussion and insuring their greatest possible action and capacity. But when this level and this balance and these dimensions of the foot are disturbed by either one or two projected heels, the weight is very apt to be thrown unduly upon the bone structure, just as an enormously extended toe, by its extreme leverage throws a preponderance of the weight upon the tendons. Either excess produces soreness, and of the two evils bone inflammation is the more tense and protracted.

VI. But it is stoutly affirmed that when the heel "*wires in*," this turned-out, projected heel of the shoe compensates for the defect. This explanation almost assumes the proportions of the grotesque. "Wiring in" is the malady that afflicts the front feet occasionally, and, very rarely, the hind ones. Moreover the inside heel is the one almost universally contracted, yet the remedy is applied to the outside one, thereby aggravating the trouble. Even if the outside heel "wires in," there is no necessity for extending the outside heel of the shoe. That, in a mechanical point of view, would prove to be an exceedingly doubtful preventive. If the outside heel was forged full, yet extended no farther back than the heel of the foot, being widened exactly the distance the outside heel "wires in," the compensation would be complete, and the balance of the foot thus restored, which the long heel fails to accomplish. This is the correct practice in every other portion of the foot where the measurements of the compass discover a want of balance, and there is no reason why there should be any deviation at the outside heel.

Thus in every point of view the long outside heel of this exceedingly popular shoe is contrary to the physiological and mechanical action of the hind limb and foot. Its only recommendation is, that to the veteran as well as the amateur horseman it has the appearance of being strikingly scientific. Farriers place it upon all light-harness horses alike, and look upon their handiwork with a wise askance, that sometimes finds its expression in such prophecies as that, "These hind shoes will make him speed as if he had wings." But in most instances the speed never comes, although this one-sided wing is welded to his hind shoe. Yet if there is the slightest improvement in speed it is attributed to this mysterious hind shoe. The average horseman, who has adopted it will exclaim: "It is immaterial to me "whether it throws the foot out of balance, "and out of level, and twists the ankle, "or not, my horse has improved with it "on, and that is a sufficient reason to my "mind for its continued use." No credit is given to breeding and maturity and training, but all praise is accorded to this unseemly shoe. Because the trotter will persistently improve, in spite of the handicaps of abuse and ignorance, as he has done throughout his existence, is that sufficient justification for the application of the old adage, to "let well enough alone," and not to stimulate a more rapid progress by removing all methods that science condemns as encumbrances? Because McMann, at Kalamazoo, in 1859,

Digitized by Google

drove the marvelous queen of the trotting turf, Flora Temple, a mile in 2:19¾ upon a course devoid of engineering skill in both construction and preparation, to a sulky weighing seventy-eight pounds with a straight bar axle and narrow shafts, with a seat perched so high in the air that the driver sat as upon an elevated tower, far above the line of the draft power, whose wheels, having many more spokes than strength and steadiness demand, reached up to the driver's shoulders, and were high enough for overshot milling; because the wonderful little queen, in addition to these handicaps, lived through the endless miles of jogging and repetitions of profuse blanket sweats that exhausted the vitality of most of the campaigners of her day; because of her triumphs, under all these difficulties, is there any reason in all this that Budd Doble should supinely adopt this paralizing policy of conservatism under precisely the same conditions as McMann did Flora Temple, instead of throwing off this "let well enough alone" policy, and seeking the kite-shaped course—the highest triumph of engineering skill, as applied to the race course, and securing the bicycle sulky, equally brilliant in design, whose ball bearings reduced the friction to the minimum, whose firm spokes destroy all ratcheting, and whose pneumatic tire compensates for all surface inequalities; and instead of blankets and sweats, calling into service the science of a competent veterinary surgeon to superintend the conditioning of Nancy Hanks, as she moved onward to champion honors? Science now has the call in the production and development of the modern trotting horse. Hence his marvelous progress. Farriery is on the move in his behalf, but still it lags behind.

It has too many forms of fanciful exaggerations as applied to his foot armament, and exaggerations in mechanical designs are always at war with the laws of mechanical advancement. When simplicity in the perfect adaptation of means to ends marks the application of farriery to the armament of the feet of the trotting horse, his improvement will receive an increased momentum. This simplicity has stricken off toe weights and heavy shoes and many other encumbrances. Before many seasons have passed it will strike off this ungainly projection of the outside heel and insist that the hind feet shall be properly balanced and evenly dressed; that the relative length of toe and height of heel shall be normal, and that the shoe, as light and firm as the best steel can insure and perfect action demands, shall be neatly fitted to the outside margin of the wall to the extreme inflexion of the heels. Then his feet will be shod for still greater performances than have made the present season the marvel of trotting-horse annals.

SOMETHING ABOUT LEAPING AND JUMPING.

BY HENGIST.

"No one jumps a five-barred gate, now-a-days, without looking for a pewter pot, with something in it, on the other side." This sentence has all the force of a proverb—truth that is widely applicable. As there is a continuous interest in jumping, we believe some space devoted to this, one of the brave equine's many accomplishments, will, at this fair season, not be altogether wasted. It is not only interesting to study and analyze, in connection with the two paces, but it valuable to study in other connections.

Is the Leap a Pace?—"Leaping may, with strict propriety, be considered in the light of a pace" [Blaine]. Though at first sight one might be inclined to dispute this, yet a few second thoughts show that it is a permissible definition of the fastest gait itself. "The racing gallop," says the same authority, "is but a succession of leaps." If we would, as indicated in our title, establish a distinction between the forms of movement for "leaping" and "jumping"—the one for length, the other for height—there would be little to quibble at in the view of leaping here presented.

Digitized by Google

The horse, we know, has been gradually specialized from a five-toed ancestor to his present one-toed state. "The evolution took the course of adapting the original form," says Laing, "to the requirements of an animal which had to live on wide prairies or desert plains, where a bulky body had to be transported at high speed, *by leaps and bounds*, over great distances, both to find food and escape enemies by flight." From the above quotation we have the general idea of the action of a horse in freedom, as it might have appeared to man for the first time.

In the April MONTHLY the able "S. T. H." speaks of "the graceful leaping action that has long been typified as the poetry of motion." [Racing, we presume, might be likened to verses of single couplets; trotting, to verses of alternate rhymes; pacing, to verses of twin couplets.] Again, he describes Salvator's racing as "prodigious leaps through the air," and the race horse as "a perfect structure for leaping." Another well-known description of racing is: "Such running it was; it was more like the long leaping of lions in harness."

Some animals, such as the kangaroo, are entirely saltatory, using only two limbs to accomplish the act. A modified form of this saltatory progression is seen in the hare and rabbit.

Of galloping Youatt has more correct views than of pacing. He says it "is, in fact, a succession of leaps, by far the greatest interval of time elapsing while the legs are extended after the leap is taken." The word *gallop* was supposed to be derived from the Anglo-Saxon *gehlopen*, to leap or jump. By later and more correct authorities this is declared to be "absurd." The word is a variation of English *wallop* or *gallop*—literally, to boil—the sound made by a horse galloping being apparently likened to that produced by the boiling of a pot. This word is thus of the class called *onomatopoetic*, that is formed from a simulation of the sound produced by the horse's hoofs in racing, a repetition of the word giving a close imitation. *Lope*, itself, is used to describe "a long step, an easy gait consisting of long running stretches or leaps." It has also been applied in this country, particularly in the western prairies, to describe the easy-running gait of the horse. This word has no connection, though it would look as if it had, with gallop; it is derived rightly from the Anglo-Saxon *hleapen*, and so has nothing in common. Such likeness is merely a coincidence.

But however legitimate or permissible these views may be, popularly, Dr. Stillman ("Horse in Motion") puts the matter practically, in saying that "the leap can not be considered as a pace; although it is a mode of progression, it is not a continuous one," as it is in the kangaroo, for instance.

So that though racing may be leaping, leaping may not be racing. Stillman was considering the high jump, not the long leap, between which, we suggest, a distinction ought to be established.

Arguments from Analogies.—A very interesting field is here opened up to the student of comparative modes of progression. If one observes even but casually the act of "jumping" or "leaping" in horse and man, as animal examples, one will observe that the spring is immediately preceded by a crouching attitude, so as to secure as firm and as extensive a foundation as possible (and during which momentary pause the lungs are inflated to their utmost) so that the great natural muscular levers obtain the fullest play and advantage, followed by the maximum of result, or greatest possible length or height. Now if we examine the peculiar construction of the kangaroo we see that nature has reduced the above requirements to actual construction. The crouching, wide solid basis, the greatest possible degree of which horse and man always endeavor to secure, is attained in a most wonderful manner. The animal, from the tip of the slim nose, is very light in the front or anterior (but which is really the "superior") portions, and gradually increases in bulk and width till its widest is attained in its posterior (or inferior) portion. The appearance might be described as that of a cone, and the natural attitude of the animal squatting or crouching on the ground with its hind limbs doubled up below its haunches. As if this was not extensiveness enough, the animal is provided with a great tail, thick at its insertion to the body, and

Digitized by Google

pering to the point. This member aids the act of propulsion. The space om the toes to the hocks entirely uches the ground, and also the thickest rtion of the tail. In rest, then, the imal is supported by three wide props. he crouching, hugging-the-ground reairement, by nature as thoroughly unrstood as it is capable of interpreting to actual structure, is perfectly atined. From this advantageous basis action the animal, easily and graceilly to itself, propels itself forward in s, to unaccustomed eyes, most peculiar ltatory manner. In the air each anial is a sort of double cone, from the iddle of which (juncture of the basis of e cones, as it were) depend the vigorous ropelling agents, the hind limbs.

Such "theory" of the requirements f the saltatory movement is interesting o study. Observe, comparatively, the rouching amount in horse and man—in he former which has only the toe tips to est on, and the latter who has the whole oot, as in the kangaroo, but much shortr, to jump or leap from. The longer the elative length from "hock" to "heel," nd the more completely these rest, natirally, on the ground the greater the listance or height that can be covered.

The larger species of kangaroo can lear as much as thirty-three feet at a single bound and can jump from seven to ten feet in height at the same time. Such is the greatest saltatory development by animals using two extremities for the purpose. It must be noted that the above figures refer to a regular continuous mode of progression; the horse has actually got records that compare with them except the last, ten feet, a height certainly far beyond the horse's attainment.

Actual Jumps.—What distance and what height can a horse jump? The writer gave a few instances elsewhere lately. A steeplechase horse, Old Chandler, ridden by Captain Broadley, 1847, covered a distance of thirty-nine feet. There appears to be more than one instance of horses clearing a height of over seven feet of actual obstruction. Turnip, a horse descended from a famous winner called Pot-8-os, performed such a feat at Phœnix Park, Dublin. It was done for a wager of £500 ($2,500). An actual wall of the height stated was built. Turnip performed the task with ease. He did it twice. The wall of Hyde Park, six and a half feet on the inside with a drop of eight feet into the road beyond, has been cleared several times. Besides the above we have the following account preserved to us of a wonderful jump: In February, 1791, for a bet of 100 guineas, a hunter, of one Hill Darley, carried his groom, weighing twelve stone, in a flying leap over a six-foot stone wall, coped and dashed. This tall performance was accomplished with neatness and dispatch. The owner also won a large sum in bets, the odds being against the horse. A large company witnessed the feat.

In 1856 Alexander Campbell, of Monzie, cleared the river Leam while following the hounds in Warwickshire, England. The Earl of Leicester when a young man (known then as Mr. Coke) was hunting a stag that had been turned out of Melton park, the seat of Sir Jacob Astley, in Norfolk. The stag, instead of taking to the fields returned to the park followed by the hounds and huntsmen. Mr. Coke was foremost on a splendid hunter. The stag dashed into the lake, and swam to an island at a distance of about thirty-six feet from the shore of the lake. The hounds followed, and Mr. Coke, without hesitating, clapped spurs to his horse, and rode at the channel which he cleared at a bound.

For the following we are indebted to a contributor of Memorabilia (who has herein been previously frequently acknowledged and quoted) in the London *Live Stock Journal*: "Major Bayley on a little Irish blood horse, cleared five feet three inches." At Rugeley Fair, an Irish dealer rode a horse over a wall dividing the road from the paddock, which measured six feet in height. Prior to the leap the price asked for this horse was £30, when he had cleared the wall the owner asked and got £50; the horse was sold before the close of the fair for £100. A Roscommon horse, near Boyle, cleared a wall six feet three inches high. An Irish horse, near Paisley, Scotland,

Digitized by Google

cleared a wall six feet high and one foot wide at the top. This jump was done for a bet, and all particulars were carefully ascertained. At a Dublin horse show a gray, named Jack Spring, three times crossed a wall six feet six inches high. Many six-feet jumpers "were common in the French park stables;" and in many Irish counties six-feet jumpers were still to be found. A wager was made by a gentleman, fifteen stone in weight, that he would produce a horse which would clear six feet with him on his back.

According to Lady Anne Blunt, the Arabs take to jumping in a perfectly natural way. She says: "The mare I rode on the journey carried me over the raised watercourses by the Euphrates in the cleverest way in the world, without the least hanging back or hesitation, and always with one foot ready to bring down in case of necessity." One of the mares brought home was let loose in her paddock on the night of her arrival. Forthwith she jumped the fence five feet six inches high. The lower rails were pulled down and she walked back under the top one, a thick oaken bar, several inches higher than her withers.

The Arabs give the name *Teneguizo* to "the leap." They think that the colt must be taught to leap, regarding the exercise as a necessary complement in the training of the colt. *El Gueloaa* is their name for the bucking leap, "the charm and crowning act of the fantasia."

Elizabeth, Empress of Austria, is the most famous, as she is perhaps the most fearless rider in the world. On one occasion she was out riding accompanied by a party of celebrated horsemen, Austrian and foreign. The Empress was riding a young horse. Passing a white milestone her horse suddenly shied, and becoming apparently uncontrollable, dashed headlong down the road in the direction of town. Her escort followed hotly in pursuit into the amazed burg. A short distance beyond this was a shipping canal. To the horror of those behind, they saw that the drawbridge was open. The Empress was rushing to destruction. An eye witness describes the next moments: "Faster and faster we went on in pursuit, but faster and faster also seemed the Empress' horse to fly. Now it had reached the open bridge. Would it stop? Before we had time to think, we saw the animal dash up the incline of the open bridge like a flash of lightning. For a moment we could not but close our eyes, and a shudder convulsed every man in the cavalcade. It was a terrible moment, a moment during which fear and horror alternately kept us mercilessly in their pangs. When we opened our eyes again, still riding as fast as our horses could go, the fair rider and her runaway had disappeared. * * * There we were, halting before that terrible bridge like a pack of cowards, with nobody among us plucky enough to ride into death with an Empress. A few seconds later the inclines of the bridge were lowered again, but nobody of our company seemed to even attempt to pass it. From the pangs of fear and horror we had passed into those of amazement. Several hundred yards beyond the bridge we beheld riding toward us a lady on a foaming steed. It was the Empress, and at her side the only gallant man of the crowd, Count Szepany. Her Majesty firmly sat her horse, and appeared as cool and collected as if nothing had happened. Smilingly did she make fun of us and our anxiety. Her fine raillery was just as much justified as it was inoffensive when she saw the pitiable figure we cut in her exalted presence. The Empress' horse was very lame, and closer examination showed that it had dislocated its right hind fetlock. In jumping the open draw between the wings of the bridge the hind feet of the Empress' horse had caught one of the iron rails at the edge and torn off one of its hind shoes. The most extraordinary feature of the accident was how the horse ever could have gone down the incline without breaking its own and the rider's neck. The only explanation for this small miracle, however, might be found in the fact that the Empress never lost her presence of mind for a minute when on horseback, and that, though the animal was uncontrollable, she must have sat it to perfection. With regard to Count Szepany, he was unable to give

Digitized by Google

account of his escape. Moreover, did not even remember whether his se made the jump before or after the press'. He simply said that during jump he closed his eyes for a second, that he then experienced a sensation though the water were bubbling over head."

"Buffalo" Jones recently made a nderful jump with his little horse Ju-. He was corraling a rather obsti-e buffalo he was breaking, that had aped from him near his ranch at Mc-ok, Neb. To outflank the animal he d to make a jump which, afterward asured, was twenty-five feet seven hes in extent besides being over a oll" three feet high and five feet de.

Standing Jumps.—In a standing leap horse steadily raises himself on his nd feet, more or less perpendicularly, cording to the height and extent of e object to be passed over. Having lanced himself a moment, he com-ences his spring by very forcibly ex-nding the previously contracted angles his hind limbs, which action propels e body both upward and forward, but ore particularly to receive it in its scent, during which change of position e hinder limbs, which had been gath-ed up to keep them from interfering ith the obstacle passed over, are now t down to receive the hindquarters.

The greatest standing (high) jump as that achieved February 24, 1792, y a bay horse of Irish breeding owned y Mr. Bingham. This horse cleared e wall of Hyde Park, London, six feet nd a half high, and eight on the outside, here a bed of dung was laid to receive e horse in his descent.

The following was recorded 1881: A oung horse, bought in Lancashire, was tanding in his stall or box with a dumb ockey on his back. The coachman and groom were coming together in the table, preparing to take the young orse out to give him his morning's les-on. Suddenly they saw the animal, with the weight still in position, jump lear over the partition, which was six eet three inches high, into the next ox. He landed, without having blem-ed l imself in any way, not so much as by the loss of a hair. My neighbors of every degree, owners, servants and hangers on, say they never saw or heard such a leap being taken standing.

When a horse attempts a standing jump he raises himself almost perpendicularly and the elevation of his body will always be found to correspond to the height of the object to be overcome. This seems to be the same standard as among athletes, who say a man should jump his own height.

The high jump is a perpendicular long leap. In the "high" the height accomplished is governed by the weight against gravitation. In the "high" or "standing" jump is most clearly demonstrated the assertion that the fore limbs are but props to the hind, which are the propellers.

The Buck and Fly.—The bucking leap is similar to that of a deer, obtaining its name from thence presumably. The fore legs and hindquarters are gathered in under the body. Hence it is a dangerous mode for both horse and rider. The flying leap necessitates the horse springing from all four legs at the same moment, or so nearly at the same time that the difference is not perceptible. The fore legs are tucked close under the body, while the hind limbs are thrown out as far behind as possible. This leap is effected over double-timber fences or for river leaping.

A "High" Kicker.—Capt. C. W. Bellairs, late in the British service, tells in the *American Field* of a famous hunter he had in his young days. This was a beautiful, powerful Welsh-bred light gray, with lots of fashion, and yet substance to carry a castle. He had every point a man could ask and seemed to be without a fault. He had one, however, and a very bad one for the country where he was hunted, the excessively hilly Cotswold—he could not bear the least over-touch of the saddle on the loins and though he would go along quietly enough, as a rule, he would, if sat down on heavily, kick and kick for ten or fifteen minutes at a time. The Cotswold country is only second to Galway in the size of its stone walls, but, while the hunting with the blazers is done mostly on the flats, that with the Cotswolds is

Digitized by Google

all up and down hill, except when by accident a fox takes to the Gloucester valley, and some of the riding when going down the steep hillsides of the range is really very desperate. A wall that shows only four feet as you go at it down hill means a landing of six or seven feet lower and this again means the necessity of lying back on the horse's croup. This was exactly what Williams, as the horse was named, did not like, and on every descent he set to work to kick until it seemed as if he would turn a turtle and send himself heels over head. He was a kicker of kickers, and possessed the faculty of kicking when off the ground and high above a fence, just as handily (or it should perhaps be said *heelily*) as if he had his fore feet nicely planted on *terra firma* and had nothing to interfere with his methods of driving his rider from the saddle to grass. Punishment would not stop him and he went on all the time, seeming about as anxious to gallop and to keep near the hounds as to kick. With each lift of his stern he would give vent to a squeal, and he really seemed to enjoy the run and kicking alike. He was terribly fatiguing to sit on and finally at a big drop on the first day he rode him Williams gave a mighty lift which nearly drove the rider over his head. The act of tightening to the saddle was accompanied with a sickening pain in both groins, and the result kept the Captain in bed on his first leave for the whole of the two months allowed young officers before joining. The gray was a great jumper, also, and could carry one over a field gun-carriage with ease.

But no sportsmen ever repines at such incidents, for:

> No sport was ever worth a rap,
> For sane, rational men to play,
> Where an accident or mishap
> Could not possibly find a way.

Mr. Apperley also refers to this "high-kicking" faculty: The most extraordinary fact relating to the act of leaping in horses, is the power they have of extending themselves by a second spring as it were, when, on being suspended in the air they perceive something on the further side of a fence, for which they were not prepared. That they occasionally do this under good riders, all good horsemen can vouch for. But whence the fulcrum is derived it would be difficult to determine.

Details of the feat of jumping over the dining-room table while loaded with the family silver and crystal, is one that the reader will occasionally meet with in English horse literature.

For leaping Youatt said the Irish horses were unrivaled. It is not, however, the leaping of the English horse, striding as it were over a low fence, and stretched at its full length over a higher one; it is the proper jump of the deer, beautiful to look at, difficult to sit, and both in height and extent unequaled by the English horse. The duke of Newcastle, in his famous treatise published in 1658, commended the northern horses of England which "excelled all others in leaping."

John Lawrence; *1809*, *on Leaping.*—Leaping is a natural action of the horse, but not that premeditated species styled the standing leap, which every horse must acquire, either by lesson or practice, in the field. A horse thus acquires the faculty of measuring with his eye the bar or obstacle to his progress before which he stands, and with a spring to surmount it, clearing any cavity or safe ground on either side. This is performed by elevating his fore quarters to the given altitude, launching forward, and as the finishing stroke, drawing up his hinder feet nearly to the level of his flanks, in order to escape hanging behind, or striking his legs against the top of the object to be surmounted. Almost any horse will take flying leaps after the hounds, but few uninstructed can be safely trusted to carry over a standing leap of any considerable height. This of course ought to be an object of careful instruction, for security's sake; and on account of the great additional worth at market of a stanch and high-standing leaper.

The Irish have always been the highest and steadiest leapers in the world. They begin to teach the accomplishment to their colts, whilst they suck, occasionally interposing a bar bound with furze between the foal and its dam, the former readily attempting a small height in order to get at the teat, and improving

Digitized by Google

its leaps as the bar becomes gradually eightened. In England they practiced eir four and five-year-olds at the bar vered with furze, beginning with about breast height. A person always stood ehind with a whip, whilst the horse was d over the bar, and touched him gently hilst his hinder quarters were in action encourage him to clear them. Patience, oolness, short lessons which do not fague or irritate, and moderate heights, the true method of forming capital anding leapers. The school is not the lace to attempt very great heights. The weight of the body renders it necesary to reduce his speed, and with it his omentum before he can safely attempt t, even when the obstruction is of modrate height.

How to Negotiate a Jump.—To take a eap on horseback with safety depends atirely on practice, nevertheless, there re a few general rules which should lways be present to the mind of the horseman. He must conquer fear and t the same time acquire circumspection. His eye must devour the objects before him, and not be closed, as actually has been known of some riders during a leap. However unpracticed the horse may be, if you determine he should leap, the execution must be left entirely to his discretion, and he must never be checked or pulled. The bit must be held perfectly light in his mouth, unless, indeed, on his landing on the other side, when he may need support. "Hold the bridle-hand loose, grasp the horse firmly with the legs and thighs, the toes being up and outward, your back inward, and your neck steady. As the horse rises meet his crest with your body, most carefully observing not to bear on the bridle, which might pull him backward. The instant his forequarters descend, and his hinder ascend, keep time with him in your appropriate, but opposite motion, and throw your body sufficiently backward to be found in your seat at the conclusion of the leap. The leap depends on freedom from all support of the bridle or stirrups, on the firm grasp of the legs and thighs, on the due and instantaneous performance of the alternate motions, forward and backward, and on the preservation of the equilibrium."

In the flying leap the chief object is to maintain firm hold with the legs and thighs, and to lean sufficiently backward the instant the spring is felt, remaining in that position until the horse has firmly landed with his hinder feet. Unless one is careful in this respect the rider may possibly land with or before him. As to taking high and dangerous leaps, and with new, hot or impracticed horses, Lawrence has remarked: "I beg to be excused. I shall not attempt to quench the spirit in others. Should they break a limb or their neck, it is their affair. There should be some men qualified by nature to mount the breach."

Man has reason to guide him to avoid impossible leaps, yet he does not always refrain. The horse has no means of avoiding or escaping the unnatural fate of such headstrong attempts, but there ought to be some check placed on all dare-deviltry.

The sort of a saddle best adapted to this exercise is a not immaterial point, which one may find out when he attempts to negotiate a jump in a "seat" not suited to the same. Among the stock breeders of California, for instance, where the old Spanish saddle is yet used, leaping is totally out of the question, "for if your horse fall you would be impaled on the piques." The running or "mooly saddle" will be found to give most freedom.

Choice of a Jumper.—Where bred "cattle" are in use much skill is required in the choice of a jumper. First he must be equal to the weight, neither leggy nor long-waisted, nor slight-boned, nor having crooked pastern joints, nor small and tender feet. If he be from training he should be well set upon his haunches, previous to being used for the purposes in view. He should have a good loin, strong and well-knit joints, should go clear of his legs, have a lofty forehead, a good mouth, a striding gallop, and reach at least a height of fifteen hands.

How the Faculty has been Transmitted.—Lord Harrington thus writes on this subject, in our London comtemporary, showing how hereditarily transmissible the faculty is:

Undoubtedly, if it were possible to have the stallions that are sent out by

Digitized by Google

the Royal Commission jumped, and if such jumping were taken into consideration in awarding the prize, we should get stallions that would show better jumping stock. It now happens too often that the dam has to find all the jumping, as there are many stallions at the stud that it was found impossible to teach to jump when in training. It may not be generally known that many years ago, in Ireland, sires were chosen for their powers of jumping, and they used to have regular jumping competitions. Some people think, and I must say I think they have reason on their side when they say, that is the reason why Irish horses jump so well to this day. We think too little in this country about this very important point, so long as the young one is really good looking, that is all we care about. How often we hear a judge say, 'Look at those thighs and hocks, he is sure to be a jumper.' Not a bit of it, he can not jump if neither his sire nor dam could. If one of them could, perhaps he can, but surely, if both could, the matter would be reduced to a certainty. I have had a good opportunity of studying this matter, as I make all my young ones jump in a school. I find the get of some horses invariably jump badly. For instance, I have several by Downpatrick (who was a very fine jumper himself), they all jumped beautifully the first time they were put in the school. I have several by a premium horse that do not seem to be able to jump at all, and will never make hunters. You will say it is impossible to have our stallions jumped; they are all shown in hand at the Agricultural Hall, London, and it would be dangerous to show them in any other way. It would at present be difficult to show many in the saddle, but it would be possible to have a class for young stallions to be ridden over jumps at the hall. If such a class should be instituted it would be a good thing in two ways. It would show that the horse had a good temper, and that he could jump, and these horses mated with good mares would get extraordinary jumpers. It sounds an odd idea to jump stallions, but I imagine more persons would enter horses for the class than people suppose. I have now, and have several times in my life had, stallions that would jump in the hall or anywhere else you chose to take them."

Miss E. Dillon, a noted horsewoman, also regrets that at most shows no stallion is allowed to compete for a jumping prize. At some shows, such as Islington (London) and Bath, etc., horses have, however, a chance. She hunts all her horses and their performances in the field are well known. Some years ago she showed a horse in the thoroughbred competition at Islington. This horse was in hunting condition and looked a skeleton beside the fat beasts exhibited. A farmer remarked: "I wonder how many of these fat beasts would get over a plowed field?" Her horse on the next day to that on which he left the show was given a brush after a severe run over deep ground with plenty of fencing. The other day a three-year-old son of this horse was tried over some jumps, and he took them like "an old hand." He, like his sire, is entire and has been at stud. The old horse Emir, was known in the field, now several of his sons are more than upholding his reputation.

Miss Dillon is quite sure there should be a jumping test for hunting sires, as her experience goes to prove that the jumping faculty is strongly hereditary. If this was the custom we should see more good jumpers than we would expect. These jumping contests would be free of all "professional" tendency—being confined to the management of reproducers.

Training.—The time-honored *Baily's Magazine of Sports and Pastimes*, of London, had an interesting account in one of its recent numbers describing a "prairie school" for jumpers. The writer was introduced to Dick, a wonderful pony, who acts as the jumping-master. He is turned loose into a ring, running out of which is impossible, and where a horse must either jump or stand still. Dick starts off at once round the fences, and is quickly followed by some three or four of the youngsters. These very soon get to learn their business and to jump in good style.

The results of training must not be confused with heredity. Heredity—its nascent power—has always been pres

Digitized by Google

nt, more or less in the animal. Train-ig, in such lines as such faculties may xist, develops it, intensifies it. The ore of each the more there will be to xpect as the combined result.

The arguments expressed as to en-ouraging, competitively, the jumping owers of sires, for instance, is evidence f the reality of the hereditary power; it an not be developed without training, hich may be either natural or artificial. ut who would train an animal in which was certain the hereditary power did ot exist? Who would train a Clyde ex-ept for draft, a hunter except for clear-ng obstacles, a trotter except for trotting?

Brain Power of Animals.—Few people, rgues one, will gainsay the fact that rain power is hereditary, as we have mple proof in human beings, and it is lso very well demonstrated in homing igeons. The young birds, although early always inheriting the homing pro-ensities of their parents, do not neces-arily inherit their physical capabilities, nd are not always such stout or quick lyers as their parents may have been. Now what one wants for in a horse, so hat he may be likely to make a good umper, are those qualities ruled over by he brain, such as good temper a quiet and illing disposition, etc. "Given a horse with good hocks and thighs, a short, strong coupled back and good shoulders, with the above-named attributes, there is little doubt that he will be a good jumper." But to excel he will have in-herited not only good brain power, but the physical conformation as well.

Miss Dillon is assured that horses jump as naturally as they canter. "My fields are divided by iron hurdles and the foals often jump them. This year a lit-tle unbroken colt was cornered in a yard, where he stood up quite straight and jumped a wall over four feet six inches. I saw a foal this year jump, in a long flying stride, rails, very nearly, if not quite, four feet high. My young horse, Iman, has a blemish caused by being impaled on a spiky hurdle at three months old. There was a big drop, and he had negotiated it successfully the first time, but the return jump being uphill was too much for him. He afterward red on a field in which there was an old sawpit with some poles, and he used to climb down and jump the poles in play. We made a jump across the pit and when he saw us coming he would stand by the edge of the pit, and on clapping our hands go down and jump the hurdles in fancy style, sometimes standing, some-times flying or slantwise, as he felt in-clined. He is a remarkably fine jumper in the hunting-field, and as clever as a rat. Many good hunters will not jump straw jumps. I tried once with an old steeplechaser, which refused sturdily and at last laid down and rolled. He carried me and other ladies afterward while in the hunting field, but he objected to a circus performance at his time of life."

Dr. Stillman, too, is of the same opin-ion: "That leaping is naturally acquired there can not be a doubt, as it is neces-sary to all quadrupeds in a wild state to enable them to overcome obstructions otherwise unsurmountable." Dr. Still-man's careful definition is a valuable statement, especially in view of the much discussed theories of heredity promul-gated, almost infallibly, by Professor Weis-man. This scientist denies that there is any hereditary force in acquired charac-ters. Now, in so far as artificially ac-quired "characters" are concerned, we might agree with him, but as to naturally acquired characters, such as the one we have been considering, which horsemen will believe with Stillman is an acquired character, we would certainly disagree with him. Training proves such char-acter acquired; breeding proves it hereditary.

Some Accidents Incident to High Jumping.—Speaking of poor Rosebery's death, his owner is reported to have said that the horse did not lose his life from pure jumping, but by an accident that might have happened in any place at any time in approaching the hurdle. He swerved and slipped, thereby straining his off hip and rupturing a blood vessel close to his spine over his kidneys, which caused paralysis. The noble animal even tried to make the jump and cleared his forward, but could not raise his hind quarters, and of course the bars came down with him. Roseberry had cleared more than this height before on the track, and had he been jumping outside on

Digitized by Google

this occasion, no doubt this slip would not have happened, and he would have been alive to-day. All the ropes and straps were actually removed and the poles were loose and only steadied in their place by the hands, so that all possible chance of an accident over the jump had been removed.

This view has received recent support from the fact that Miss Cahill, "the high-kicking soubrette," slipped and burst one of the largest arteries in her body situated in the leg (sciatic or branch). Fortunately it was not in a dangerous position and the agile lady recovered. If it had been in a position in proximity to other organs, recovery might have been impossible.

Split Pastern.—This is, says Fleming, "a more or less longitudinal fracture of one or even both bones of the pastern, produced accidentally and most frequently on landing while jumping. The peculiar formation and situation of these bones predisposes them to fracture in this way." In the opinion of some veterinarians "it is sometimes impossible to tell whether it is due to accident or disease. Mr. Clement Stephenson. F. R. C. V. S., before a British Royal Commission on horse breeding, and whose authority stands unchallenged said: "I have seen a case where it was transmitted to the progeny, although produced by accident." It would be interesting to confront Weismann with the above bit of experience. On the other hand Lord Harrington had "three broodmares that all had split pasterns. They were bred to a split-pasterned horse, and the progeny are all right in their pasterns." How was "predisposition," the new explanation of heredity, affected in these cases?

THE SPORT OF KINGS.

WE give our readers an intelligent article on racing as it is in old England to-day, depicted by Jeannette L. Gilder in an exchange:

No wonder that horse racing is called England's "great national sport." Besides whole libraries which have been written on the subject for and by Englishmen, there are at the present time three daily journals, as well as a dozen weekly papers, exclusively devoted to what has been called "the great game" and other sports. In addition to these the daily newspapers contain full accounts of the race meetings, and also publish weekly commentaries on the sport at considerable length. The latest addition to the literature of the turf is called "A Mirror of the Turf, or the Machinery of Horse Racing Revealed, Showing the Sport of Kings as It Is To-day." The author is Louis Henry Curzon and the publishers Chapman & Hall, of London. Mr. Curzon treats at length of the dark side of horse racing, and has a great deal to say about the frauds and chicaneries of the turf. He explains as his reason for this that racing has unfortunately become a business of the most sordid kind. The majority of men engaged in the "sport" run their horses only as "instruments of gambling," while not a few of them, to ensure sucess, condescend to practices that will not bear the light of day. The turf gambling of the period, according to Mr. Curzon, has become enormous, but few outside the range of racing circles have hitherto had much knowledge of the immense amount of money which changes hands day by day in the various betting rooms, or the enormous turf clubs that abound in almost every city and large town in the kingdom. Just at the present time there is a tremendous outcry in New York, not so much against horse racing as against pool rooms, and Mr. Curzon's book will be read, by those who have an opportunity to read it, with particular interest, as it denounces in strong terms and with knowledge the practices that are going on in London and in this city to-day.

TIPSTERS AND THEIR METHODS.

After writing about the history of the turf and giving a *resume* of some classic races, Mr. Curzon gives us a chapter called "With the Prophets," the prophets in this case being those persons who follow the profession of "tipsters." A point worthy of notice in connection with the advertisements of these gentry is the

style now adopted in fashioning them. New and improved methods of communicating with the public are constantly being devised. Tipping nowadays is a "business" of importance, requiring large dealings with the telegraph; but long ago—say about the close of the "thirties" and in the "forties" of the present century, when the writer of this book became interested in horse racing, consequent on having won a few sovereigns by the victory of Merry Monarch in the Derby—tipping was very much less obtrusive than it is to-day, and was carried on chiefly by means of what may be called "disguises."

The first of the prophets to whom Mr. Curzon refers were a man and a woman, both persons of ability, able to assume a variety of characters, and by doing so to carry on their little game industriously from season to season. There was no collusion between them, however, as they were in no way connected. The man, before he began work as a tipster, had been for several years under butler in one of the big Pall Mall clubs, and, having made a goodly sum of money by a fortunate bet, gave up his butlership and opened a public house in a little street off Fetter lane. The landlord's turf proclivities attracted turfmen to his house, but he himself became the victim of a turf sharp, and his house was wrecked by an indignant mob. It was then that he set up as a tipster, and under the designation of "a retired club steward," offered to give all who pleased to forward half a crown to his house in Pemberton row the horse which would win the Derby. Some of his prophecies proved good and business thrived, but the tide turned and his patrons fell off. Then he advertised under another name, as "late valet to a sporting nobleman, who, being in possession of several important racing secrets, will send the winners of two thousand guineas and chester cup to a select number of gentlemen on receiving a remittance of five shillings." Once again luck was on his side, and he did well for a time, but at last he stopped completely out. The woman tipster was a Mrs. Merryweather, who, under various names, masculine and feminine, carried on a thriving business.

Nowadays the business is carried on much more extensively, and without disguise. At the present time there are tipsters who carry on business in a different fashion. Some ask for a fee that will cover a week's work, while others are willing to take a percentage on successes. As there are a great many fools in the world, these tipsters make a good deal of money, but they seldom keep it. The proprietors of several weekly racing periodicals with large circulations send out, so Mr. Curzon says, daily tips by telegraph, or "pen rightly letters to all who will pay the requisite fee," and, according to their own accounts of what they achieve, their success as tipsters is great.

EXTENT OF THE BETTING MANIA.

The enormous extent to which betting on horse-racing goes on all the year round is known to those only who make the matter a special study. It has been computed by persons who should know that not less than 5,000 bookmakers are daily engaged throughout the United Kingdom in laying the odds against horses at stakes ranging from sixpense to perhaps, on some occasions, as much as £500 or even £1,000. In one Scottish city there are, it has been calculated, 100 bookmakers at work every day on the streets or in clubs or offices, doing business with all comers at market rates, and to stakes varying in amount from shillings and half-crowns to "tenners and ponies." According to this calculation London would have 1,000 bookmakers. "Here everyone bets," said a London club steward one evening to Mr. Curzon, whilst busy entering names for the annual Derby sweep, "everyone from the city to the West End; the cabman who brought you from the railway station, the porter who took your hat, the man who sold you that copy of the special *Standard*, all bet, and in hundreds of our public houses and tobacconists' shops you can find a bookmaker if you want him."

"To affirm that a sum of from £4,000,000 to £5,000,000 is annually risked in bets on horse races in Great Britain looks," says Mr. Curzon, "like wishing to play on the credulity of the public, but good reasons exist for believing that

Digitized by Google

the amount named is about right, and under rather than over the real total could it be ascertained. It is still possible to back a horse running in a big handicap to win from £20,000 to £50,000."

There are writers on turf matters who maintain that there is not now so much betting as there used to be, but that contention can only apply to particular races, for Mr. Curzon has every reason to believe that there is in reality five times the amount of turf speculation to-day that there was forty or fifty years since. He takes Scotland as an example. Half a century ago there was no person there earning a living by "bookmaking" alone. To-day in one city there are 200. There may not be so many big bets as there were half a century ago, but there are a great many more smaller ones. The great obstacle to big bets being made is "the miserly rate of odds now offered by the bookmakers." In the case of Surefoot, that did not win the Derby in 1890, "the odds laid on that horse at the start required the investment of £90 to win £40, a luxury that only people with more money than brains were able to afford."

Many schemes are resorted to by the bigger class of betting men to obtain information. Jockeys are pumped, trainers are interviewed, stablemen are bribed with the view of enabling the "plunger" to land a big bet or two at every meeting. There are men, of course who would scorn to take a vulgar money bribe, but who do not scruple to receive a case or two of champagne, or a ten-gallon cask of whisky, nor are they very angry when some energetic person sends their wife a diamond ring or their daughter a gold watch. Upon one occasion, while visiting a training establishment, Mr. Curzon was struck with the display of jewelry which adorned the person of a trainer's wife. Likely enough, none of the wives of the owners who had horses in that man's stables possessed such a valuable collection of gems as she wore on her fingers and bosom, nor did the lady evince much reluctance about giving their history.

It is the most extraordinary thing that ready money betting is decried in England, and an attempt has actually been made to prove it illegal. Why betting with ready money should be wrong, and betting on credit should be right, is something that only a very prejudiced person can be made to understand. Betting between private friends the writer of this book regards as a "horror of the worst description," and in that I thoroughly agree with him.

THE ENGLISH JOCKEY AS HE IS.

Mr. Curzon has a very interesting chapter on jockeys. In Newmarket and other racing stables there are a very large number of boys employed, one for each horse, most of whom are apprenticed while very young to the trainers, to be taught the business of a groom. Only a small number of these boys develop, however, into passable jockeys, and fewer still into what may be termed great horsemen. Many of the lads grow so rapidly that they soon become useless in the racing saddle, but as there are more than 1,000 stable boys and only, perhaps, twenty jockeys of repute, it is obvious that the prizes, as in other professions, are few and the blanks many.

These stable lads are taught their business with much care, and in every respect are well looked after. They are taken to church every Sunday, and in some training establishments there is a Sabbath school and other training as well. One trainer, a remarkable man in his calling, not satisfied with two visits to church for his lads, invariably read to them at night from one of Blair's sermons. If one of the boys was so unlucky as to fall asleep he was at once brought to a sense of his iniquity by a touch or two from a long whip which his master kept beside him ready for use. Discipline is strictly observed in a racing stable, but, as a rule, the lads are humanely treated.

A successful jockey is petted like a prima donna and made a companion by sporting lords. His movements are chronicled as carefully as those of a prince of the royal blood. His photographs are in constant demand. He is surrounded by a host of parasites; his "mounts" are "backed" till they are quoted at the shortest odds; his opinion of the animal he rides is anxiously asked

Digitized by Google

r by owner and trainer, while the ragged regiment of gamblers who pin eir faith to his horse" are pleased ith a smile even from his valet. Sport-g journals publish his portrait and rnish their columns with criticisms of s riding and anecdotes of his career; s bon-mots are circulated as witticisms, d his clothes are imitated by the vulgar.

A PROFITABLE CALLING.

Moreover, he earns a larger income an a prime minister, his services being trigued and paid for with a power of plomacy and at a rate of remuneration ly known "on the turf." The fees on by a successful jockey form the least rtion of his income, as the presents ven him by owners of horses and nu-erous "admirers," in the shape of bettors ho have backed his mounts, are fre-uent and valuable. Gold watches, dia-ond rings, and breast pins set with ibies, riding horses, dog carts, and achts, as well as suits of clothes, new ats, boxes of cigars, and cases of cham-agne, fall to the lot of fortunate jockeys ho win important races. Money gifts successful jockeys are now, however, e order of the day, and are often of reat magnitude. It is well known, for stance, in turf circles, that the jockey ho rode "Roseberry," the winner of the Czarowitz at Newmarket, was presented by the owner of that horse with a check for £1,000. The jockey who rode the winner of a sensational Derby was presented by the owner of the winning horse, "Hermit," with a sum of £3,000. The policy of paying large sums to jockeys has frequently been discussed. The interests at stake, however, since the horse became the instrument of gambling it now is, are so gigantic as to render it imperative that jockeys be placed beyond temptation. The total value of the stakes which were contested during the year 1890 amounted to considerably over £446,000, not to speak of the sums dependent on wagers, which were probably ten times that amount. Race horses are frequently backed to win sums of from £1,000 to £100,000. The horse called Hermit, which was victorious in the sensational Derby already referred to, won for his owner £100,000, so that he could well afford to pay his jockey £3,000 as a testimonial of his gratitude.

After reading these facts and figures one is left to reflect on the peculiar division of spoils which brings the jockey not only higher pecuniary rewards than literature ever brings to its professors, but even higher than falls to the lot of the Prime Minister of so rich and great a country as Great Britain.

TROTTING REFORMATION.

Disquisitions on breeding trotters are leasanter topics than sermons anent the anagement of trotting affairs; pleas-nter, at least, for the writer, and, as a ule, more satisfactory to the reader. o long as controversies are conducted in ood temper and with proper fairness, ontestants are likely to evolve something hat will be beneficial to breeders, and ith these conditions fulfilled, as ex-ressed by good nature and a desire o be just, with advantage to them-elves.

We are all more or less partisans, and ince the days of feudal allegiance noth-ng is so likely to engender one-sided feel-ngs as advocacy of particular families of ses, more so when trotting lines are der discussion than thoroughbreds occasion, though far beyond all other themes to incite is that when near crosses of thoroughbreds in fast trotters forms the subject of contention. It appears to awaken an acrid temperament in many who take the negative of the proposition, and I must also admit that oftentimes there is a good deal of foolishness displayed by advocates on both sides. But while there are so many opinions regarding the breeding of fast trotters, there is one point where agreement is nearly unanimous, that being the necessity of reformation in the handling of trotting meetings in order to increase the popularity of what may be termed harness sports. Unanimity in one respect, the only possible disagreement being the details, the better methods of carry-

Digitized by Google

ing the purpose to a successful termination.

Breeders are, by far, the largest in numbers and the most interested division of all other classes which are anxious to secure improvement in trotting methods, and owing to these improvements enlarge the field of operations and increase the demand for the products of breeding farms. Few, if any, will contradict the statement that racing, in the last decade, has completely overshadowed trotting, in the way of attracting people, especially near the large centers of population, where "big crowds" are the most readily gathered. Completely overshadowed is none too strong a phrase to express the difference between the two branches of sport, clearly shown wherever brought into juxtaposition. New York presents the most emphatic endorsement of the truth of the statement, Chicago, St. Louis, Cincinnati and other cities not far behind with corroborating testimony. It may be taken for granted, then, that racing at the present time is altogether superior to trotting, in the estimation of the sport-loving public, and it will be a legitimate use of that knowledge to search for the cause of greater popularity.

Not very many years ago trotting was the most popular in all of the middle, western and northern states. Immediately after the close of the war the only race meetings which attracted attention were those held in the vicinity of New York. Without going over the whole field, and as it will serve my purpose for illustration, the history of racing in Chicago will be the topic, and though necessarily the account will be brief, it will be sufficient to form a basis of comparison, and explain one of the causes for the retrogression of trotting, while racing has taken an upward flight, astonishing the most enthusiastic of its votaries, verifying, or rather, so far exceeding the expectations and prophesies of a quarter of a century ago, that amazement is almost too tame a word to express the feelings of those who witnessed the start. The first regular race meeting ever held in Chicago may be dated 1864. Some twenty years before, a few horses took part in races there, but the meeting was unimportant. The story of the meeting in 1864 can soon be told. In 1860 or 1861 a Mr. Smith built a track between Michigan avenue and State street, north of Thirty-first street, the northern boundary, I think, Twenty-first street. He held a fair on it in which there were premiums for trotting and running.

The project did not pay, and in 1863 a club was organized called the Chicago Driving Park association, rented the track of Hon. John Wentworth, and gave a trotting meeting the fall of that year. I attended with some horses and assisted the officers in managing the business, and was employed by the club to take the general management during the season of 1864. A trotting meeting was the first regular event of the season and in some respects it was quite noteworthy.

There was a large amount of money at stake for those days, $13,000 in ten purses, and unusally large wagering on every race. In one of them in which Harry Clay defeated Quaker Boy, Jim Rowell and Princess, more money was laid than I had ever seen on one trotting race up to that time, the owner of Quaker Boy losing $22,000. Greenbacks were plenty and the spirit of speculation ran very high. The spring race-meeting at St. Louis had been very successful, and I was extremely anxious that Chicago should take a hand in the "legitimate," urging the association to "get up" a meeting if even the beginning was on a small scale. With an abiding faith in the locality and enterprise of the people I felt assured that it was destined to be a great "racing center," and talked, wrote, and labored to get others to think enough of the project to give it a trial. Few, very few, agreed with me. The trotter was so far away in the lead in the affection of the people that it seemed like throwing away "good money" which the trotters had earned to give even a small portion of it to the "leppers." That was before the day of the bang tails, and that derisive epithet was freely bandied by those who favored slang above argument. Persistency, however, carried the day, and I was authorized to get out a program, of which the following is a copy:

Digitized by Google

RIVING PARK COURSE, CHICAGO, ILLINOIS.

HE FIRST REGULAR RUNNING MEETING

for the Fall of 1864, will commence on

SDAY, SEPTEMBER 6TH, AND CONTINUE FIVE DAYS!

IRST RACE—Sweepstakes for two-year-olds; dash mile; $100 entrance $50 forfeit, with $100 added if stake is run. Three or more subscribers to fill. ame and close the 25th of Aug., 1864.

ME DAY.—SECOND RACE—Mile heats, best three ve; all ages. Purse $500.

WEDNESDAY, SEPTEMBER 7TH.

IRST RACE—Sweepstakes for all ages; $100 entice, $50 forfeit, $100 added if the race is run; mile ts. Three or more subscribers to fill. To name close the 25th of August.

ME DAY.—SECOND RACE—Heats of two miles, ll ages, carrying 100 pounds; $300.

THURSDAY, SEPTEMBER 8TH.

weepstakes for three-year-olds, mile heats; $100 enice, $50 forfeit, $300 added if the race is run. Three ore subscribers to fill the stake. To name and close 25th of August, 1864.

ME DAY.—SECOND RACE—Heats of two miles, ll ages; Purse $500.

FRIDAY, SEPTEMBER 9TH.

IRST RACE—Purse $200, with an inside stake of p p.; mile heats, best three in five.

ME DAY.—SECOND RACE—Handicap Purse $200, an inside stake of $50, half forfeit; $10 declaration. ies to be made Tuesday, the 6th of September. ights announced at the close of Thursday's two- race, dash of two miles.

SATURDAY, SEPTEMBER 10TH.

eats of three miles, for all ages; Purse $800.

all of the above purses, three or more entries reed to fill.

With the prevailing antagonism to ing it could not be called a bad beining and it was a labor of love on my rt to do all I could to make the meet- successful. Made two trips to Kenky, bought a two-year-old and threear-old of "old" John Harper to put in colt stakes; attended the race meets and was so fortunate as to obtain a r list of entries. The great Idlewild k a part, though defeated by Surse, a son of Bonnie Scotland and a ndson of Fashion. Panic, Bowen, st Roxbury, Kate Duncan, Abe Beker d several others of note contested and attendance much better than was icipated. There was not a man in the ociation, with one exception, who ew anything of "racing law and the ages of the turf," and Dr. Weldon s employed to preside—probably the st instance in America where a "paid lge" was in the stand. As will be n from the bill, the start in every race s from the stand, judge and starter ed by one person, the signal being a wack on the drum.

Little enthusiasm was awakened in ing, but a strong opposition from who favored trotting. A "combined meeting" was the program for the summer meeting, 1865, but the opponents of racing succeeded in having the track coated with cinders from a rolling mill which, of course put an interdict on racing on that, and an inside one which was built was far from being adapted for fast galloping, and racing and racehorses played an unimportant part thereafter on the old cinder track. I resigned my position of secretary and general manager after the close of the summer meeting. The state fair was held on these grounds the fall of 1865, with some liberal purses for trotting. The following year was sadly notable. Dexter made his first western trip, was defeated in a saddle race by Butler, his half owner, George Trussle, was killed by a woman who bore his name, and not long after McKeever, the driver of Butler, was mortally wounded while engaged in a race against Cooley. The murder of McKeever, for murder it was, though the intention in all probability was to cripple the horse, raised a whirlwind of excitement all over the country. He was a general favorite, genteel in his deportment, so genial that every one he met was attracted, and in place of having enemies it is safe to assert that everyone, however brief their acquaintance with him, was friendly. I attended the meeting again assisting in the management, but left for my home in Iowa immediately after it closed, and as the race with Cooley came off afterward, was not present. There have been many misstatements in regard to that melancholy affair. Not long ago a paragraph went the rounds of the papers that McKeever was killed on Dexter park and that was the cause of the stockyard course being broken up. Although that raised an intense feeling, horror, indignation on the part of the citizens of Chicago, and large rewards offered for the conviction of the culprits, that tragedy was not the cause of the Driving park being abandoned.

A glance at the map will show that even as long ago as 1865 the ground on which it was constructed was not very far from the center of the city, and that one of the main thoroughfares, Wabash avenue,

Digitized by Google

ran through its building on State street, was advancing with rapidity, and there was a general clamor to open the streets. Mr. Wentworth had struggled for years to keep the property intact. He gave a verbal promise that if streets were not forced through he would convey it to the city in his will for a park. The condition being that it should be called Wentworth park, but he refused to make a deed at that time. I remember distinctly a visit that Mr. Wentworth made to the judge's stand during the meeting and urged the directors to stay the opening of the streets, agreeing that if successful he would extend the lease indefinitely, payment of taxes being the whole rental. Opposition did not avail, the streets were opened and the Chicago Driving park a thing of the past.

It may not be amiss to mention *en passant* that it was a "paying concern." All the money paid in when the club was organized was $7,500. Tens of thousands were expended in improvements, and when broken up there was quite a handsome dividend to the stockholders. On that course was what may be called the initiation of racing in Chicago, the probationary period, the Dexter park era. The opening year on that had little in the way of racing reminiscences to chronicle, but in order to keep up the continuity of the story an outline sketch will be proper.

John B. Sherman and William F. Tucker were the lessees of the Hough house, afterward rechristened and better known under the name of Transit house. Mr. Sherman was a large stockholder in and superintendent of the stockyards. Mr. Tucker was also the landlord of the Briggs house, in the city. A. F. Fawsett was a dealer in live stock, and though a resident of Baltimore owned a good deal of property in the vicinity of the stockyards. In 1867 he owned Dexter. Mr. Sherman had quite a strong fancy for trotters, especially road horses, and at Mr. Fawsett's solicitation the track was built. It was completed in time so that a meeting might have been held in midsummer, but in order to obtain the attendance of the crack trotters the date fixed September 1 for the opening day, which gave the horses engaged in the grand circuit a chance to participate.

The proprietors sent for me to assist in "getting up" a program and take charge of the trotting department of the fair. Racing was not in accordance with the views of either of the proprietors. The superintendent of the track, George B. Mansur, was bitterly opposed. But we incorporated an exhibition department confined to horses, the show premiums and minor races being decided in the forenoons and the main trots in the afternoons.

It is worthy of note that Chicago was the first place to offer big money for harness races, over $16,000 being appropriated for purses, the show premiums swelling the amount to nearly $20,000. That year Buffalo gave $12,000, Narragansett park $10,000, and these were next in order. Dexter made his last public appearance on the park to which he gave the name, and this time there was no defeat to mar the brilliancy of his farewell of the public. Contrary to a large majority of prognostications, the morning sessions drew out a fine attendance, and on the afternoons of the big trots large crowds assembled. A blank year as regards racing, but the following, 1868, made amends. That year John J. McRimero, an enthusiast in racing affairs and in all pertaining to the blood-horse, succeeded in imparting a fraction of his enthusiasm to the proprietors and formulated a program which was a long way in advance of any heretofore announced in the Northwest and left the initial meeting of 1864 ever so far behind. It embraced fifteen events, $12,000 given in purses and added to stakes, and as no entrance fee was charged that large amount was given outright. This for a five-day meeting and before bookmakers came to aid, monetarily, was certainly liberal. The arrangement of distances augured favorably, judging from the knowledge of the day. A three-quarter dash for two-year-olds, two dashes of two miles, dash one mile, three-year-olds, two races, heats of a mile, two "3 in 5," dash of 2½ miles, heats of 3 miles and 4 miles, dash 2 miles over 8 hurdles, handicap hurdle 2 miles and consolation purse 1¼ miles. It is easy to see

re it would be faulty were the ent the test, but twenty-four years he past places it in a different light. hat summer I passed in New York, igh it "goes without saying," that first big Chicago race meeting was not ed. In high glee, too, that the prohesies our years ago appeared to be in the of fulfillment, and that the "City on Lake" had earned the title to one of "great racing centers," so far as en-aging the owners of horses to do their . The response was hearty. There e ten starters in the first race, heats mile, Gilroy won it. The second, same distance, Pat Malloy won. The sher won the first heat, seven to t. The two-year-old race was won Alta Vela, eight ran. The hurdle s were won by Lobelia, and her er had good reason to rejoice that e were offered. When he reached stockyards he had only five cents. freight on the mare was unpaid, but unately for him Mr. Sherman was ent, and settled. The first hurdle was a stake of $25 p. p., $1,000 ed, all going to the winner. Edin-was in it and he had the record, I think, and Lobelia's owner was ewhat despondent, although he felt st confidence in his mare, but being ad broke" the outlook was gloomy. offered the owner of Edinboro the nings of Lobelia for $200, but was rejected without giving it a nent's consideration. The first race ed $1,100, so that he was on velvet the second, and in that he again beat nboro, 132 pounds up, while Lobelia 145 pounds to carry. Plantagenet both long races, heats of three and r miles, and Pat Malloy the dash of and a half miles. Twelve starters in consolation, a big field for those days, brought to a close a meeting which a success and a failure. Those who ored trotting to such an extent that were wholly absorbed in that line sport would not attend and influenced ers to stay away, and the expenses, side of the money given for the races, re far heavier than they should have n, so that the loss was quite vy on Messrs. Tucker and Sher-That opposition was not satisfied with working against the success of race meetings. I argued that there should be no antagonism between saddle and harness sports, that properly managed one would aid the other by cultivating a fondness for both, and notwithstanding the loss on the big meeting another might prove remunerative. The proprietors consented, and things were progressing favorably, when the old tactics, which proved victorious at the Driving park, were again put in force and again won the day. The plan was to coat the track with Joliet gravel, which had the quality of "packing" with greater compactness than cinders, and Mr. Sherman informed me that he had become so thoroughly tired by the importunities that he had consented and would have an inside course prepared. All that could be done in time for the advertised meeting was to plow and harrow, and to add to the trouble rains fell during the first days of the meeting. Two miles were run in 4:31¼. As good a horse as Victory was distanced in the first heat of three miles in 6:10, the second was run in 6:29 and when the track was at its best Gilroy was also distanced in a 3 in 5 race in 1:59¾. And yet this caricature of racing had attraction, quoting from an account published in a daily paper: "The closing day of the races at Dexter park attracted a large concourse of spectators; they packed the grand stand and the ladies' stand was filled with a brilliant gathering of beauty and fashion. Outside of the ropes as many as a thousand carriages and other vehicles were counted, and the number of visitors in all estimated at fully 7,000 person." It took just 7,000 paying visitors at the regular admission fee, $1, to cover the cost of coating with gravel, and, as is well known at the present time, was not "the thing" for trotting, especially for training trotters.

The last meeting I was connected with was held in 1873, at Dexter park, a combined display of trotting, running and pacing. It covered four days and the purses were liberal, in fact big—$31,700 for trotting, $8,000 for running and $500 for pacing, nearly a round $40,000, close to $10,000 for each day. Successful financially, although rain fell

Digitized by Google

on three of the days, part of the time a deluge.

But if I were to go into even a short history of all the old-time meetings in Chicago it would take far too much space for one number of the MONTHLY, and as enough has been shown to base my argument upon, will bring the reminiscence part to a close.

From these brief statements it is evident that when in its infancy racing had a troublesome time in Chicago, and when out of the cradle it had to fight for a foothold. It fought under the disadvantage of being still burdened with the traditions of the past, and though partially rejuvinated, faulty methods were not entirely relinquished.

Trotting with everything in its favor tenaciously clung to obsolete ideas. That illiberality which sought to kill a kindred sport also tended to foster a spirit of bourbonism, an intense conservatism that abhorred the thought of "advanced ideas;" that favored a Chinese wall against innovations; that had more faith in their own narrow circle than in new worlds outside. Racing progressed, trotting at a standstill; and in accordance with established laws, retrogression. Chicago, which in 1873 gave $31,700 for four days' trotting, and which drew an attendance of 14,000 people in one day, fell back and back until an outside association took the matter in hand and that failed too, until one step forward was made. From the $8,000 for racing in 1873 until the present time, there are such a succession of advances that mere reference is all that is necessary to be able to draw a parallel.

It would seem an act of wisdom on the part of managers of trotting meetings to study the lessons which racing presents and endeavor to profit by the example. Let us take a look at the main divergences. The racing program does not show large sums of money appropriated for special premiums, that specialty being celebrities coming one at a time, upon the stage, making a polite bow, cavorting around the arena, and raising a whirl of excitement if a fraction of a second is subtracted from the time some other celebrity has accomplished. It "draws" unquestionably, but at the expense of thousands who are not endowed with speed enough to secure a star engagement. This emasculated racing may answer the purpose of bringing people to the track who would not come if the exhibition were withheld, but the bulk of the receipts go to the star, and the education that teaches that the only real sport in trotting is witnessing a surprising effort "against time," is not the correct course when the welfare of breeders and owners is taken into consideration The only handicaps in trotting, or rather the only attempt to equalize the chances of horses to win, is a classification based on time made. That this does not answer the purpose is so evident that argument is supererogatory. There is not so good a chance to "bring horses together" in trotting as there is in racing, but something might be done by a change of distance, and in place of the stereotyped mile at a time increase the length of the contests. And now that a sulky has made its appearance which unquestionably enables a horse to go faster than with the best of the old patterns, a genuine trotting handicap could be inaugurated. What with carts of different weight, old-fashioned sulkies and the pneumatic tire, a range of several seconds to the mile could be harmonized and that without loading a horse to an injurious degree. If heats must be the integral in a trotting program, surround them with such safeguards that every heat will be a *bona fide* struggle between the horses engaged, and in this way emulate the spirit of the dashes in running.

How quickly the managers of the race meeting at Washington park corrected an evil akin to laying up heats by announcing that horses *must* run for a place. I do not intend to moralize over the betting features of race and trotting meetings. That speculative mania has always existed, and in all probability will continue in force so long as horses contend for supremacy, and that must be managed so that everyone will be protected. If protection can not be awarded in heats, there is no guarantee that the race of heats will be any better, and to grant that heats can not be governed is to admit that there is no such thing as

honest trotting. This laying up heats, in my opinion, has been one of the causes, if not the main cause, for the waning popularity of trotting. Until heat racing was practically done away, it had a depressing effect on that branch of sport. It permitted combinations to the detriment of straightforward turfmen, and gave sharpers a chance to carry out schemes which were not many degrees above trick-of-the-loop and thimble games. Still more baneful its effects in trotting. Losing races a logical sequence to losing heats and gave people an idea that the system of ethics which prevailed on trotting tracks was an extremely low standard. Were anything wanting to prove the general demoralization among those whose interests are so closely identified with the well-doing of trotting, the storm which followed an attempt of the National Trotting association to remedy the evil would be ample testimony. Several prominent drivers were indignant, one of their most highly cherished prerogatives was attacked, and rigorous protests entered against the passage, or rather the enforcement of a law which denied them the privilege of fooling the people. Many writers on trotting affairs were incited to strong expressions of dissent, ridicule being freely employed, and members of the convention who favored the passage of the act denounced for endeavoring to relieve trotting from an incubus which was crushing it to the ground. To show how ancient customs swayed the minds of some men, two of the directors of a prominent trotting association were in favor of adding a condition to their program that the rule forbidding laying-up heats would not be observed, and at the same time advocated the withdrawal of the clause limiting the number of heats which a horse could start in to three, if not a winner of one. See-sawing must be stamped out. Look over the summaries of the late meeting at Washington park, and if one man of sound mind, who is not hopelessly bigoted in his support of old methods will sanction the practices which these summaries disclose, I shall be disappointed. Next to the abolition of specials, the question of restricting the number of starts granted non-winners of heats will elicit the most contention. For the doing away of the practice of giving large sums to sensational performers, all the breeders of trotters, all the owners of trotters, should present an unbroken front. Managers of trotting meetings who are anxious to secure as much "gate money" as can be collected by the incitement of celebrated names, the owners of celebrities, and those who make money from the display of their powers, will advocate the retention of this feature. But I would urge on managers to study racing methods and commence to follow them, and by rigidly adhering to the determination to discard all that is not *legitimate* racing, and with joint action on the part of the main trotting associations, it can be remedied in one season. The heat question is just as easily handled. Racing folk have nearly discarded heats "three in five," a past recollection and in the few races of heats still on the bills a horse must win one in two to entitle it to start in the third. "Three in five" races are yet so largely in the majority in trotting that practically they are the whole bill. To enliven this oftentimes weary parade of tired horses, listlessly dragging for an entire afternoon their leaden feet mile after mile, the maneuvering by astute drivers to "make a killing," the apparently interminable scoring to the intense disgust of ninety-and-nine per cent. of the spectators, anything which gives promise to remedy a part of these tribulations, should meet united approval in place of antagonism. Fortunately the opposition is mainly confined to drivers, and when trotting associations realize the thraldom they have been under for so long a time to this order of trotting men, the bonds will be sundered.

Scoring, scoring, scoring. Could this be remedied and the tedium of long-delayed starts be in a measure overcome, it would be worth millions to the trotting-horse cause.

It may appear as the extreme height of assumption to recommend racing methods when the long delays at the post, the breakaways, the straggling starts which are so frequently witnessed

Digitized by Google

when the most competent starter wields the flag, and yet I do not hesitate in proffering such advice.

In old times the starter of race horses was enthroned in the judges' stand. Look over the old programs, take for instance 1856. Opening a volume of the *Spirit of the Times*, May 10, of that year, there are twelve advertisements of race meetings, not a race under one mile, that a dash of a mile for two-year-olds, and not one of fractions. That of the Fashion Course, N. Y., is a fair sample. Heats of four miles, three miles, two miles, heats of a mile, three in five, and heats of a mile. The starter, therefore, had only one station, as the courses were a mile in circuit. From his commanding perch he ordered the jockeys and those in attendance on the horses, and gave the word by striking a drum. The only difference between the running starter in 1856 and the trotting starter in 1892, in place of a drum, the trotting official taps a bell or vociferates "go."

Fractional distances compelled stationing the starter away from the judges' stand, and that was so manifestly an improvement that when races began under the winning score he was placed there, and then, still better, a few yards from the wire.

Now for my proposed plan. Adopt that much of the racing method in having the starter separated from the judges, and also follow the racing rules in that being his whole duty. Station him say from fifty to 100 yards up the stretch on a pedestal of sufficient elevation to overlook the horses and drivers. Place a flag a certain number of yards, say seventy-five, still further up the stretch, between which points all the horses must turn. Another flag 100 yards beyond the judges' stand as a mark for the horses to be pulled up after a false start. Give the starter an assistant to aid in getting the horses marshaled between the designated points, seeing that they are in their proper places, etc. The starter must, of course be given full authority to fine the drivers for misbehavior, and that without an appeal for remission being considered unless sanctioned by him. No one who has had any experience with starting race horses and trotters will contend that the trotters are nearly as hard to control as race horses, men in place of boys being in charge, and nothing like the reluctance on the part of the trotters to come up. Were trotters subjected to the same cruel punishment in a race that racers suffer the like backwardness to start and excitement would follow.

The starter and his assistant are in a situation to better observe what the drivers are doing, and he can insist that the horses be brought up at a pace which is within the rate of them all. The point from which the time will be measured is far enough in advance to give the opportunity of getting the horses in their full stride, and the only object in hurrying to the starting score will be to get the best of it. Fines will be a potent correction of that desire, and when the drivers are fully impressed with the idea that endeavors in that direction will not only fail, but also subject them to penalties, they will have to be satisfied with an equal chance. When the starter gives the signal to start there shall be no recall. When the signal is not given there should be a bell within his reach to give notice, a bell being better than a flag when trotters are recalled, as the whole occular attention of the driver is frequently required to manage his horse. And then it is always better that the man who sends them off should be the one to recall, avoiding misconception, and not infrequently it has happened that one judge has "given the word," another has rung the bell. Isolation is surely an advantage to the starter. When he is one of a trio he is subjected to advice which, as a rule, does more injury than good. Many which would have been good starts have been passed from an associate crying out not to start, and bad ones given, due to the same interference. That this system of starting in running is an improvement on the old plan will not be denied, at least it would be a hardened believer in the efficacy of ancient things over modern who disputed that assertion. That it will be still more potential in trotting I am firm in the belief, and aid materially in diminishing the time required to get races under way, confident, too, that drivers, when fully schooled in the method, will give it preference, although a majority of

em do not accept novelties with good race. But "the public," the people ho frequent trotting tracks, more important to please them, and still more so conduct trotting affairs so that the far rger number who do not attend trotting meetings under present methods, ill be attracted and swell the gate receipts from hundreds to thousands.

I would like to see the trial made by ne of the first-class starters of race orses, who had acquaintance enough ith trotting to know when they were 'on their gait," and be able to discover tendency to come up on a pace, single-oot, hitching, etc. The advantage he ould have over a trotting man would be hat he was accustomed to deal with reactory jockeys, and was not awed by rivers who control big stables. There ould be lots of protests, threats of staying away, no more entries, etc., and take lenty of backbone in associations to sustain a starter of the right stamp. But he public would be with them and fortunately times are different now than they ere a few years ago, and reforms must nd will prevail no matter who endeavors o wreck the train which carries the progressive battalions.

JOSEPH CAIRN SIMPSON.

Oakland, Cal., September 19, 1892.

Defaulting Trotting Associations.

TO THE EDITOR:

The failure to pay premiums in accordance with the advertisements by such prominent associations as the Grand Rapids Horsemen's association; the Des Moines Driving Park association; the Richmond Driving Park association and others of less prominence, has justly caused widespread dissatisfaction and distrust among the horsemen of the country, which will doubtless have a damaging effect on the trotting interests. Whether this disastrous condition of affairs is the result of reduced entrance fees, poor management or worse than either, bad faith, is a mooted question and some adequate means must be devised, if possible, to insure the payment of purses offered and the sacred holding and paying of stake money contributed nominators.

The rules of the National and the American Trotting associations give exactly the same protection and impose the same penalties on associations as on horsemen. A horseman making an entry and failing to pay, is suspended until the claim is paid, and the suspension follows the horse for a period of six years regardless of change of ownership. An association failing to pay its purses or stakes is, upon application, suspended until the claim is paid, and the claim attaches to the grounds regardless of sale or lease.

The trotting of horses has ceased to be a matter of sentimental amusement, and has become a legitimate occupation, and must be conducted on the same basis as any other recognized business. The same rules that apply to bargain and sale must necessarily attach to trotting engagements. The horseman must exercise his judgment as to the good faith and responsibility of associations. The associations have the privilege of demanding the entrance fee with the nomination, but as is more frequently done, require the entrance to be paid before starting in the race, and upon failure to pay depend upon the machinery of the parent association to collect by suspension of man and horse. Thus, as in other business, it is, to a large extent, a matter of good faith between the contracting parties.

The innovation of stake races for the trotter has become deservedly popular, and will doubtless be more so in the future, provided such safeguards are thrown around them as to insure a faithful performance of the conditions and prevent misappropriation of the stake money. There should be but three kinds of stakes permitted by members of the American or the National associations:

First. A stake where the nominators contribute all the money to be trotted for.

Second. A stake where the nominators contribute a specified amount, to which the member adds a specific sum.

Third. A guaranteed stake for a specified amount, for which the member is responsible, the excess, if any, to be added to the stake.

No other conditions should be permitted to attach to a stake and the money

Digitized by Google

contributed by the nominators should be paid direct to the parent association to which the member belongs, by it held in trust subject to the decision of the judges of the race and the rules governing it.

Where the member adds money to the stake the added money should also be deposited with the parent association. In a guaranteed stake the member should be required to give a bond to make good any deficiency that might arise from lack of nominations to make the amount guaranteed.

Both parent associations have ample means to carry on their business, are not engaged in any enterprise that would call for the expenditure of money to be recouped by gate receipts, entrance fees or sale of privileges which might be affected by bad weather, competition or other causes. The parent associations are ably conducted by competent officers who give ample bonds for the faithful discharge of their duties. If such rules were adopted by the parent associations a fruitful source of litigation caused by senseless and ambiguous conditions would be obviated and the breeders of the country could make nominations with a feeling of safety not possessed under the prevailing practice of the present period.

The two associations should call a special meeting of their congresses before the first day of January, 1893, to be held at some central point at the same date, and adopt this needed reform, for without so doing concerted action can not be had, as they meet alternate years, and rules can only be made by the congress.

"BREEDER."

EDITOR OF THE MONTHLY:

In speaking of the Pilot Jr. mares in your last issue, you mention "Dixie, 2:30, dam of Dixie Sprague, 2:25¼; Zephyr, dam of Baroness, 2:30." You might have added, also, dam of Bay Dixie, the dam of Monitor Chippie, 2:27, and of Monocrat, 2.27¾. These records were obtained by Monitor Chippie at the late meeting at Sedalia, Mo., and by Monocrat at the late meeting at Louisiana, Mo., on a very slow half-mile track.

Yours, etc., N. J. COLMAN.

St. Louis, September 26, 1892.

An Old-Time Trotter.

Forty-five years ago a little round-shouldered Frenchman was sitting in the old Stanwix Hall, Albany, when several of the "talent" of that day were discussing the merits and demerits of the then most noted trotters. Two thirty-five or thirty-six was at that time about what 2.07 or 2.08 is now.

That little Frenchman moved his chair nearer the company, and, looking at the fullest patterned man in the crowd—General Dunham—asked what would be given for a horse to trot in two "tirty." Judging from the look of scorn and disgust on the faces of the little company, one would think he would have been frozen out of the room. But consciousness of being in the right makes one assume an expression not easily disregarded. The little Frenchman didn't move, but said:

"I show a mile in two tirty."

He seemed so much in earnest that the General made an appointment with him, then and there, to meet him at the track and see the horse go, half suspecting something phenomenal. He made the arrangement to meet the little fellow at five o'clock in the morning. The little Frenchman was there, and had been waiting half an hour. The horse was hitched to an old-fashioned high-wheeled spring sulky, weighing about one hundred and twenty pounds. To make a long story short, the little innocent from Canada showed them a mile in 2.29. This clip had never been seen before. General Dunham, who died only a few years ago in West Twenty-fourth street, bought the horse—old Moscow—and paid $10,000 for him. This was the highest price ever paid for a trotter up to that time.

Those who were in the secret of this exhibition and purchase were very sure that as soon as the horse could get used to a sulky of sixty or seventy pounds, he could trot in 2.25. Of course, with such an instrument, they could break everybody and retire with millions. But to the fact. They never drove him better than 2.30 with all the new appliances they could employ, including smaller wheels and lighter frame.

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, OCTOBER, 1892.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00
All in one order..... 35.00

Doubling Up Good Blood.

FANNIE SWOPE, 2:19¼, that is by the inbred Hambletonian stallion Florida and out of a mare by Mambrino King, has been bred to the great two-year-old trotter Ralph Wilkes, 2:18, and as he is by Red Wilkes it will be seen that Fanny Swope's foal by him will have a lot of Hambletonian blood backed up twice by that of Mambrino Patchen, Mambrino King being a son of that horse and the dam of Ralph Wilkes his daughter. This sort of breeding is a kind that men who are looking for the very topsawyers among race-horse trotters will be indulging in more and more from this time on.

It is being proven in the production of trotters, just as it has been in fixing a type of animal life in other directions, that a certain amount of inbreeding is necessary to produce the highest results in the direction aimed at. It has been demonstrated beyond question that the union of the blood of Rysdyk's Hambletonian with that of Mambrino chief, American Star, Pilot Jr. and some other strains has given us our best trotters and the greatest percentage of standard speed. The blood of Hambletonian through his son George Wilkes, which horse got a Clay cross through his dam, has been especially potent in producing trotting speed of a high order when crossed with that of Mambrino Patchen, the latter being unquestionably the best son of Mambrino Chief, and the fact that he is a brother to Lady Thorne, 2:18¼, one of the greatest trotters of her day, adds to the value of his blood in the eyes of those who believe that the laws of heredity which obtain in other departments of animal life must also make themselves felt in the case of the light-harness horse. It is now being found that in addition to producing extreme speed in the first generation the Wilkes-Mambrino Patchen cross is breeding on with great regularity, as witness the stallion Simmons, who in addition to himself beating 2:30 with little preparation and also being a brother to Rosa Wilkes, 2:18¼, has sired about as much 2:30 speed as any horse of his age in the world. It is therefore an intelligent move on the part of the owner of so fast a mare as Mattie Swope, that is by an inbred Hambletonian stallion, and out of a mare by the greatest son of Mambrino Patchen, to mate her with a stallion of the calibre of Ralph Wilkes, himself a sensational two-year old and combining the same general lines of blood that are prominent in the pedigree of Fannie Swope, thereby doubling them up in the produce and imparting to the foal an intensified, inherited predisposition to adopt the trotting gait and attain a high rate of speed at that way of going.

It may truthfully be said that with few exceptions the breeders of trotting horses are thoroughly converted to the idea that not only are developed parents the best from which to breed in the hope of securing trotting or pacing speed, bnt also that it is practically a waste of time and money, now that developed trotters of both sexes are so numerous, to experiment with any other kind where more than an ordinary work horse or common driver is expected in the produce. The trotting season of 1892 has thoroughly established the fact that not only are stallions which themselves have a great deal of speed siring nearly all the young stake winners, but that this rule works (as by all the rules of logic it should) just as well in the female line. The great broodmares of the future and the best young broodmares of the present day are those which in addition to having a fair amount of breeding, are also the possessors of records which make them standard. Mill Girl is a case in point. She is by Jay Gould, a horse that when foaled

Digitized by Google

combined the best blood lines of his time, being by Rysdyk's Hambletonian, and out of an American Star mare. He was likewise one of the fastest trotters of his day, winning all of the six races in which he started and making a record of 2:21½. From Dolsey, a mare by a little pacing stallion known as "The Shaffer Pony," Jay Gould sired two fairly good trotters in Mill Girl, 2:22¼, and Mill Boy, 2:26, their second dam being by Vermont Black Hawk. Mill Girl was foaled in 1878 and made her record in 1887. This was only five years ago, and yet she now has three representatives in the 2:30 list: Wilkes Maid (2), 2:25⅛; Wilkes Girl (3), 2:28¼, and Capitana (2), 2:30, all by the developed stallion Young Wilkes, 2:28¼, a sonof George Wilkes, 2:22. Mill Girl has produced five foals, three of which are already in the 2:30 list at three years' old or under, and a yearling pacer out of her and by Count Wilkes, a son of George Wilkes, has already shown quarters in thirty-five seconds and is expected to beat 2:30 before the season closes. Her other foal is said to be fast, but that cuts no figure, as from what Mill Girl has already accomplished in the breeding ranks she has stamped herself as a great producing mare.

It will not escape the attention of thoughtful men that her performers thus far are by a stallion whose record is 2:28¼, and who in turn was sired by a horse with a record of 2:22. Also it is a notable fact that Mill Girl herself has a record of 2:22¼, that her sire is a trotter with a mark of 2:21½, and that her dam was by a pony which showed considerable speed at the pace. There is nothing but trotting and pacing blood in any of the near lines of the pedigrees of Mill Girl's performing foals, and even an approach to thoroughbred blood is not made until the American Star strain is reached through Jay Gould, as the dam of the sire of Mill Girl's 2:30 performers was by Prince of Wales, a son of Royal George. Mill Girl herself was not esteemed a particularly great trotter when on the turf, and in common with the rest of the get of Jay Gould was forced to bear the stigma of faintheartedness which attached to that branch of the Hambletonian family just as it did to the Happy Medium tribe. But now that a daughter of Happy Medium has beaten the world's trotting record the status of that horse's get is being viewed in the light of reason instead of prejudice and people are beginning to see that while Happy Medium was kept in Philadelphia during the best years of his life the class of mares bred to him did not as a rule have particularly good blood lines, and that those of his sons and daughters that have come out as trotters recently and that are from the mares bred to him in Kentucky, have plenty of speed and the determination to carry it to the end of the mile. Nancy Hanks is an inbred Hambletonian, her sire and the sire of her dam being sons of that horse, and in the light of recent experiences it is probable that when she is retired from the turf she will be bred to a stallion of the Hambletonian family, most likely Arion, 2:10¾, a son of Electioneer that is the champion two-year-old trotter of the world. Arion also carries a double infusion of Hambletonian blood, his sire being a son of Hambletonian and his dam by Nutwood, a great-grandson of the same horse, so that if Arion and Nancy Hanks are mated, the resultant foal will have in the near crosses of his pedigree so many strains running direct to Hambletonian, that they will practically form a network, and to them alone will inevitably be credited whatever merit the colt possesses.

Will Electricity Get Pacers?

AMONG the stallions at the Palo Alto ranch of Senator Stanford the big black horse Electricity has been more or less famous ever since he was foaled, a matter of eight years or so ago.

In the first place there was a good deal of talk, long before it was born, about the foal by Electioneer and out of Midnight, because, although even at that time Electioneer was a great sire, the fame of the Pilot Jr. mares, and especially of the one that had produced Jay Eye See and Noontide, the latter having a record of 2:20½, while Jay Eye See had been a four-year-old champion with a mark of 2:19, a five-year-old phenomenon with 2:10¾ to his credit was national, while the doings of Maud S. and other trotters out of Pilot Jr. mares had demonstrated that the blood of the stallion that was got by a Canadian pacer was prepotent to the highest degree when united with that of the Hambletonian family. It was also a fact that none of Electioneer's trotters was from a Pilot Jr. mare, and there was consequently all the more curiosity and interest among horsemen and breeders over the outcome of his mating with a representative of the Pilot Jr. family that had already furnished a double champion in Jay Eye See and a 2:16 mare in Noontide, it being a well-known fact

Digitized by Google

that the mare's record was no measure of her speed.

When the offspring of Electioneer and Midnight came it proved to be a colt, and to add to the excitement of the occasion the old mare died soon after maternity's pains were over, so that it was necessary to bring the youngster up under circumstances that as a rule are not favorable to the best development of horseflesh. But Electricity, for so the colt was named, grew like a weed, was so big and gangling, in fact, that the usual forcing process in vogue at Palo Alto was in his case dispensed with. As a six-year-old he beat 2:30 several seconds, and last season reduced his record to 2:17¾, a respectable mark for any horse. And now comes the news that his first descendant to start in a race, a yearling called Jesse, has carried the banner of Electricity to the front in great style, doing his mile in 2:45½. Of course the yearling trotting record is 2:25¼, but breeders are well aware that any yearling which beats three minutes is above the average and will call attention to its sire. That Electricity should at eight years of age have a stake-winning son is a great card.

And now that his get are showing speed, the question at once arises: "Will Electricity get many pacers?" It is a fact that the Electioneer blood has not thus far been potent in the production of speed at the sidewheel gait, but the conditions surrounding Electricity are in this respect different from those which environ other sons of Electioneer. There is nothing characteristically Electioneerish, to coin a phrase, in the general make-up and appearance of the big black stallion, and in color he corresponds with his distinguished half-brother Jay Eye See. This last-named horse has been a turf sensation this season by coming out when fourteen years old and pacing to a record of 2:06¼ after having been a champion trotter with a record of 2:10. It may be claimed that in the case of Jay Eye See the pacing inclination comes from the Dictator side of his pedigree, and not from the Pilot Jr. strain, the fact that Dictator got Director, and that he in turn produced the pacer Direct, 2:06, being a strong card on this side of the contention, but it is nevertheless true that the sire of Pilot Jr. was a remarkably fast pacer, and anyone who has had experience in breeding horses is well aware that family characteristics of that sort are pretty hard to keep in the background. On the other hand it has always been the policy at Palo Alto to permit no animal bred there to assume the pacing gait as a mode of progression, the ukase of the proprietor being that if colts could not trot they should either run or walk. The enforcement of this rule will of course militate against the chances of Electricity becoming a sire of pacers, but the fact that his dam was a member of the Pilot Jr. family, and has produced a 2:06¼ pacer can not be overlooked.

The Dash Race Idea.

In a recent number of the Monthly appeared an article on the subject of dash trotting races, the same consisting of an expression of opinion by a number of well-known breeders. That article has been extensively copied, appearing in nearly every journal devoted to the interests of the trotting horse, and a discussion has been begun which can end only in a fair trial being given trotting dashes. It has already been noted in these columns that the Kentucky Association of Trotting-horse Breeders, under whose auspices there is given at Lexington in October of each season one of the most successful trotting meetings in the country, has decided to include in its program for the coming meeting a number of dash events and to one of them has been given the name the Phœnix Hotel stakes. This event is a dash of a mile and an eighth for trotters of the 2:14 class, the idea being to bring together a number of exceedingly fast horses and test them at a distance a trifle over the ordinary one, the amount of money added, $800, being sufficient to induce a starting of only first-class trotters. At the Columbia, Tenn., meeting which follows close upon that at Lexington, there will also be a number of dash races decided, and if they seem to take well with the public and horsemen it is promised by the Lexington association that still further advances in that direction will be made next season, in which case it is probable that at least half the racing on the card each day will be in the shape of dashes.

Of course there is a variety of opinions on this subject but still the general trend of editorial expression is in favor of the innovation. Mr. Joseph Cairn Simpson takes up in *The California Breeder and Sportsman* one phase of the subject, that of distance, and treats it as follows:

If dashes, in place of heats, rule at trotting meetings, as they do on the turf, great care must be taken in fixing distances which will attract public attention. There is a preponderancy of short dashes in racing, owing to owners being more anx-

ious to engage in contests which will tax their horses as little as possible and permit them to run often than to take part in longer, although more popular with the race-going public, but a greater tax on their powers, and, consequently, necessitating a longer interval between their races. Owing to the difference, in nearly every respect, between racing and trotting sport, short racing contests are more interesting than when trotters take part in the spin. Saddle and jockeys, in place of vehicles and drivers, larger fields, a higher rate of speed, etc., it is evidently supererogatory to go into details to understand the causes for preference. There is one huge stumbling-block in the way of dash-trotting which did not obstruct the racing field—a big bowlder, more than a fragment of rock, its rounded and polished sides covered with numerals. From the nearly obliterated scrawl which marked the astounding performances of Boston Blue to the deeply-cut and diamond-decked figures which tell the last great story of trotting and pacing speed; there are histories of every epoch, nearly every side of this enormous register taken up with the Arabic tokens, and nearly every legend under the same caption; the minutes and seconds and fractions of a second in which a mile has been trotted and paced. One would be apt to think that this sameness would pall on the senses, and, recalling the old maxim that "variety is the spice of life, which gives it all its strength and flavor," there must come a change. Vain delusion! At least, so far as those who are the most deeply interested in trotters are concerned, time is everything; the record for a mile the one thing worthy of supreme effort, everything else of so little importance that it can not be said that they are in the race. These folk, like people addicted to narcotic stimulants, appear to have become more and more infatuated, until nothing but a mile, and a fast mile at that, can awaken any interest. I was forcibly impressed with the prevailing craze in a conversation a few days ago, when dashes for trotters and pacers was the topic under consideration. One of the party held that it was imperative that one mile should be the limit, and, when pressed for a reason, replied, in order that a record for the conventional distance could be obtained. This to him was the grand total, the summing up of all the advantages, and while agreeing with the others that shorter distances were inadmissible, to increase them to one or more miles and fractional parts of a mile, there was no record of time, previously made, and, consequently, no chance for comparison. Two miles might do if horses could be found to trot that distance; three, four, five miles would *not* answer, inasmuch as the time, when divided by three, four or five, would be slower than if the same horse had only a mile to overcome. That argument, so confidently advanced, in my opinion is favorable to the adoption of distances which are novel. The time craze will not be an overwhelming issue, and the actual contest of greater interest. Then, too, the distances can be arranged so as to give a fairer chance to all the contestants. One mile and three-sixteenths, for instance, will afford a chance to score, and also give the benefit of over three hundred yards of straight work after the start, enabling the horses to get steadied and secure positions before the turn is reached. One mile and eleven-sixteenths would secure similar advantages, though still better than distances divisible by sixteen, those which would require pencil and paper to "cipher out" the equivalent for a mile, thus dethroning that bug-a-boo which has reigned with imperious sway for half a century at least. It is quite likely that a large proportion of those whom clowns have held in subjection will repine and grumble and give vent to ill-temper, to the discomfort of those enjoying the contest, but they can find relief by timing the last mile, and, as in all probability that will be faster than it would had the dash been limited to 1760 yards, that should be a recompense for going contrary to their views. Could something be invented to lift trotting management out of the deep rut it has apparently got in to stay, a great boon it would prove to the interests depending upon good management, something like the pneumatic tire in effect, which would stimulate the brain, remove the inertia of long years' standing and set the mind bounding and ricocheting out of and over the indentations, the long-ago grooves, hurl the bowlder aside with its hundreds of legends with one caption, and bring the whole of the sport-loving public into touch with the sports of the track.

Mr. Simpson's views are those of a man whose experience with trotters covers more than a quarter of a century, and as he is known all the country over as a breeder and driver of trotters, as well as a graceful, polished and forceful writer upon trotting topics, his words on this subject of dash racing are well worth reading. The other side of the subject is taken by the *American Trotter*, which paper has always opposed dash races, although thus far unable to present any very valid reasons why they should not at least be given a trial. Says the *Trotter*:

The subject of dash races as an element of the plan by which to increase popular interest in trotting meetings, co tinues to receive consideration, and appears to be growing in favor. It seems probable at any rate that something will be done next year to shorten the contests, and if the extreme measures above referred to are not adopted, at least the heats will be reduced to two in three. It should be understood that the demand for shorter contests on the trotting tracks comes not from the associations nor from the breeders, but that any change from present methods in this connection is in deference to what is supposed to be the desires of the spectators at the races. Indeed, the inauguration of dash races means either a sweeping reduction in the size of the purses, or a pecuniary sacrifice to the trotting associations, for where under the present plan, two or three events are sufficient to fill an afternoon, there would be opportunity for a half a dozen dashes, each requiring a purse. We do not believe that dash races can ever become popular with the breeders, nor can they have the effect of developing a hardy, courageous, enduring class of horses. The very best justification of their use that has been stated, is the alleged fact that they will suit the public and improve the facilities for betting. It seems likely that they would accomplish the latter purpose, but as to the other, only a trial can determine their status in public opinion. There is one class of single heat races that might be introduced with benefit to the trotting horse and edification to the public, and this is the dash of two, three or more miles, a revival of which promises to be seen next year. A race of this sort might furnish some sort of an idea of the quality of the horse's endurance as well as speed, and there is little doubt that a close, vigorous contest of the above character would awaken a lively interest among all privileged to see it.

The Philadelphia *Record*, whose proprietor and editor has long been an owner of fast trotters, says:

Make the races two-in-three; give three contests in the afternoon; sandwich between these races mile dashes to harness, wagon or saddle, and one two-mile dash—such a program would give six good races each day and attract large crowds of spectators. Which track will start it? Make the dashes for purses of $100 or $200, and the entries $10 or $20. They would fill, and soon put the trotting tracks to the front. Have the horses up promptly, and avoid long waits between heats. Favorites are often beaten before they go a heat by judges permitting unnecessary scoring. These things disgust the public and help make trotting unpopular.

"Aurelius," one of the best known writers in the country on turf and breeding topics, said not long ago to a reporter for the *Kentucky Stock Farm*, speaking of his visit to the Independence trotting meeting: "From what I saw there I am more than ever impressed with the idea that to make trotting races popular, it will be necessary to make each heat a race, that is, allow no laying up whatever. When this is done I fully believe the trotting turf will soon become as popular as the running turf."

In a recent issue of *Clark's Horse Review* the

Digitized by Google

or of that paper in the course of an article eat betting, which practice he deprecates, incidentally: "There is great conflict of ion between breeders and turfmen as to most advisable methods to be used in the ing efforts to popularize the trotting turf. s generally admitted that the painfully -drawn-out contest, almost an inevitable lt of the three in five heat system, will e to go, along with many of the practices ch gave them being."

Sires of 2:20 Speed.

HE present season has brought to the front re horses of extreme speed among the ters and pacers than it appeared probable, n after the speed revelations of 1891, could sibly make an appearance during any npaign. While the production of horses able of a mile in 2:30 has now reached h proportions that something like a usand of them may be expected to put in appearance every year, and while the 2:20 t has grown to gigantic proportions, it will found by an examination of the records for 92 that perhaps an even greater proporate showing is made when it comes to imals that have demonstrated their ability to t a mile in 2:15 or better, as on August 15, is season, thirty-three trotters had for the st time made records of 2:15 or better, this mber being equal to the entire 2:15 list at e close of 1890. These thirty-three horses at have entered the 2:15 list in 1892, together ith their blood lines in the first generation re as follows:

NAME.	Record.	Sire.	Sire of Dam.
Martha Wilkes	2:08	Alcyone, 2:27	Clark Chief
Moquette	2:10	Wilton, 2:19¼	Ericsson, 2:30½
Lord Clinton	2:10¼	Denning Allen	
Battle H	2:11¼	Abdallah Mambrino	Octoroon
Lobasco	2:11½	Egmont	General Hatch
Evangeline	2:11¾	Director, 2:17	Red Wilkes, 2:40
Magnolia	2:12½	Haw Patch	Bourbon Chief, Jr.
Ryland T	2:12¾	Ledger Jr	Ulverston
Alix	2:12¾	Patronage	Attorney
Little Albert	2:12¾	Albert W., 2:20	
Ponce de Leon	2:13	Pancoast, 2:21¾	Cuyler
Paragon	2:13¼	Storm King, 2:29½	Lord Coke
So Long	2:13¼	Erelong	Harold
St. Vincent	2:13½	Wilkes Boy, 2:24½	Mambrino Boy, 2:26½
Kentucky Union	2:13½	Aberdeen	Balsora
New York Central	2:13½	Simmons, 2:28	Mambrino Boy, 2:26½
Lakewood Prince	2:13½	Wilkesonian	Woodford Mambrino, 2:21½
Nightingale	2:13½	Osgood's Patchen	Mambrino Howard
Walter E.	2:13¾	Patchen Mambrino	s. t. b. son of Wagoner
Junemont	2:14	Tremont, 2:28½	Jack Rosey
Steve Whipple	2:14	Hambletonian Chrisman	Whipple's Hambletonian
Muta Wilkes	2:14¼	Guy Wilkes, 2:15¼	Sultan, 2:24
Nightingale	2:14¼	Mambrino King	Wood's Hambletonian
Instant	2:14¼	Startle	Belmont
Honest George	2:14½	Albert	
Globe	2:14¾	Almont Jr., 2:26	Hamlin Patchen
Hazel Wilkes	2:14¾	Guy Wilkes, 2:15¼	Arthurton
Geneva	2:14¾	Leland	Edwin Forrest, 49.
Hulda	2:14¾	Guy Wilkes, 2:15¼	Bull Pup
Norval	2:14¾	Electioneer	Norman 25
Trailold	2:14¾	Simmons, 2:28	Clark Chief
Belle Vara	2:15	Vatican, 2:29¼	Estill Eric
Richmond Jr	2:15	A. W. Richmond	

A noticeable feature of this list is the fact that of the thirty-three trotters comprising it no less than sixteen, or practically fifty per cent., are by stallions with records better than 2:30, which is certainly quite a card in favor of the developed-sire theory. Looked at from another standpoint it will be seen that the developed sires are more than holding their own when it comes to the production of 2:15 or better trotters, as in the above list there are six that are four years old or under, and four of these are by sires with fast records, they being:

Name.	*Record.*	*Sire.*	*Record.*
Moquette (4)	2:10	Wilton	2:19¼
Evangeline (4)	2:11¾	Director	2:17
Muta Wilkes (4)	2:14¼	Guy Wilkes	2:15¼
Hulda (4)	2:14¾	Guy Wilkes	2:15¼

It will be noted that Guy Wilkes has had three of his get enter the 2:15 list this season, which is an honor shared by no other stallion. In fact the only other stallion that has had as many as two of his get enter the 2:15 list this year is Simmons, and it is a notable fact that both he and Guy Wilkes are bred in precisely the same lines so far as the first cross on each side of their pedigrees is concerned, they being by George Wilkes and out of daughters of Mambrino Patchen. This analysis of the 2:15 list for 1892 places in a very strong light the merits of the Wilkes strain of blood when it comes to the production of extreme speed, as nine members of the list, or more than one-quarter of it, are by sons of George Wilkes.

And writing of this matter of siring extreme speed, there comes in very pat at this time a statement, printed in *Clark's Horse Review* of recent date, showing that seven stallions had ten or more representatives in the 2:20 list up to August 15 of the present year. These horses, arranged in the order of merit from the standpoint of their 2:20 list, are:

Name.	*Rec.*	*No. in 2:20 list.*
Electioneer	——	24
Nutwood	2:18¾	18
George Wilkes	2:22	14
Red Wilkes	2:40	14
Guy Wilkes	2:15¼	11
Onward	2:25¼	11
Alcyone	2:27	11

Digitized by Google

It will at once strike the reader that not only does every one of these seven stallions that have sired ten or more 2:20 performers trace directly in the male line to Rysdyk's Hambletonian, which is a significant and instructive fact, but also that George Wilkes is a member of the list and that four of his sons are also to be found there, leaving only Electioneer and Nutwood in the seven select sires that do not belong to the Wilkes family. It is certainly a severe test, this one of taking a list of stallions that have sired ten or more 2:20 performers, and it is of interest to know among other things the year in which each one was foaled, as it is only in that way that a fair comparison between them can be made. This information is given herewith, together with the age of each stallion. George Wilkes has been a long time dead, and in his case allowance must be made for the fact that he has had no opportunity of siring speed of any sort since 1882. Electioneer died only a year or so ago.

Name.	*Foaled.*	*Age.*	*No. in 2:20 list.*
Electioneer	1868	24	24
Nutwood	1870	22	18
George Wilkes	1856	36	14
Red Wilkes	1874	18	14
Guy Wilkes	1879	13	11
Onward	1875	17	11
Alcyone	1877	15	11

This tabulation shows the superiority of Guy Wilkes in a more marked degree than any other exposition of the subject that has been made, because at thirteen years of age there are only four horses that lead him in number of 2:20 performers, and the youngest of these, Nutwood, was foaled nine years before Guy Wilkes saw the light, and has eighteen 2:20 or better trotters to eleven by Guy Wilkes. At the present rate of progress made by Guy Wilkes he will, if he lives to Nutwood's present age, have nearly or quite twice as many 2:20 representatives as the great son of Belmont now has. Onward was foaled four years before Guy Wilkes, and Alcyone two years in advance of the California stallion, yet they are only a tie with him as to 2:20 performers.

Greatest of His Age.

No young trotting sire has shown more prominently this season through the performances of his get than the California stallion Sable Wilkes, and his prestige is now so great as a sire of early trotting speed that something more than a mere mention of the fact that at eight years of age he has seven representatives, in the 2:30 list, one of them, a yearling, and four that became standard by performance at two years of age is his due.

Herewith is given a list of the 2:30 representatives of Sable Wilkes to date:

Name.	*Record.*	*Sire of Dam.*
Freedom (1)	2:29¾	Arthurton.
Sabledale (2)	2:18½	Nutwood, 2:18¾.
Ora Wilkes (2)	2:21¼	Director, 2:17.
Macleay (2)	2:22¼	Nutwood, 2:18¾.
Sabina (2)	2:27½	Le Grand.
Native Son (3)	2:28	Arthurton.
Lou Wilkes (3)	2:29¼	Guy Wilkes, 2:15¼.

No other horse ever made such a showing as a sire of baby trotters as has Sable Wilkes, and it is doubtful if the near future will produce one who will equal or excel him in this respect. In view of this important consideration to breeders it will not be amiss to call attention at this time to some facts which unquestionably have had influence in placing Sable Wilkes at the head of all trotting sires of his age. To begin with, it is significant that Sable Wilkes himself was a precocious trotter, being at three years the champion stallion of his age with a record of 2:18. This makes it clear that not only is he a horse of more than average speed, but that his ability to trot fast was a natural gift and not the result of long-continued training in skillful hands. Looking then to the blood lines of Sable Wilkes for a possible explanation of his surpassing merit as a three-year-old of his day, it is found that in the male line of his pedigree there are two conspicuous records held by horses of unquestioned merit as campaigners, they being Guy Wilkes, 2:15¼, the sire of Sable Wilkes; and George Wilkes, 2:22, his grandsire, back of which comes Rysdyk's Hambletonian. Along this line of developed trotting speed are reinforcements through the dams of Hambletonian, George Wilkes and Guy Wilkes, which mares were respectively by Bellfounder, Harry Clay and Mambrino Patchen, the second dam of Guy Wilkes, being a fast trotting daughter of Seeley's American Star. So much for the paternal ancestors of Sable Wilkes. His dam is Sable, a daughter of The Moor, a trotter whose record is 2:37, but who was capable of a mile about five seconds faster than the figures given. The dam of Sable was Gretchen, a famous producer, she having given the turf Del Sur, 2:24, and sire of the pacer San Pedro, 2:10¾; Inca, 2:27, sire of Incas, 2:14½; Romero, 2:19½; and Neluska, 2:30½, dam of Nehushta, 2:30. This great producing

Digitized by Google

re Gretchen was sired by Mambrino Pilot, horse that had a harness record of 2:34¾ l one of 2:27½ under saddle, he being by mbrino Chief and out of a mare by ot Jr.

t would be difficult to find a horse in whose ns there flows more performing and pro-cing trotting blood than is contained in the ments constituting the pedigree of Sable lkes. Looking at his breeding, resplend-with trotting records, it is not a matter of rprise that in his day he should have been champion three-year-old trotting stallion; d it is equally plain to be seen whence mes his precociousness and wonderful tency as a sire. To have a yearling in the 0 list and a two-year-old in the 2:20 list is mething no other eight-year-old stallion s accomplished, and the success as a sire the trotting-bred trotter Sable Wilkes is those who believe in sticking close to otting blood strong evidence of the impreg-bility of their position.

The Best Two-Year-Olds.

The two-year-old filly, Rowena, that recently ok a race record of 2:19½ in California, is a reat card for those who assert and believe at a large infusion of thoroughbred blood of distinct value in a trotting pedigree, as er sire is from a thoroughbred mare, and her am is likewise thoroughbred. This makes owena carry over eighty per cent. of thorough-red blood; but while on paper this is a tre-endously strong showing for the upholders f the theory referred to, there are other facts connection with the blood lines of this are which can not be overlooked, and which the estimation of most people who have ad to do with trotting horses and have given e subject of their breeding considerable at-ntion have a direct and potent bearing on e case.

The first one of these is that Azmoor, the re of Rowena, was, although out of a thorough-red mare, a naturally fast and level-headed otter, making a record of 2:20½. This ability trot, and the inherent disposition to stick to e trot, came to Azmoor from his trotting sire lectioneer, a horse that according to the pub-c testimony of Charles Marvin was driven a uarter by that eminent reinsman in thirty-our seconds. Electioneer, as everybody knows, as intensely trotting-bred, being by Rysdyk's Hambletonian, a fast trotter in his day, and out Green Mountain Maid, a remarkably speedy mare at the trot; she by Harry Clay, a trotter with a record of 2:29. In other words the blood of Electioneer, a stallion whose action-controlling power was greater than that of any other horse in the world, produced from a thoroughbred mare the stallion Azmoor, that, instead of taking after his dam and becoming a runner, took after his sire and became a trotter, just as did Palo Alto, another son of Electioneer that was out of a thoroughbred mare, and that trotted to a record of 2:08¾. Electioneer has got extreme trotting speed from three classes of mares — thoroughbred, trotting-bred and pacing-bred — and when from thoroughbred mares he sired level-headed trotters like Palo Alto and Azmoor, it is not at all extraordinary that these horses should in turn get other fast trotters, even from thorough-bred mares. That Electioneer did not always sire trotting speed from thoroughbred dams is well known, and that from the same mare he could on one occasion get a fast trotter, one that took so naturally to that gait that he was a remarkably handy horse in his breaks, and another that would sometimes be driven for hours before striking a trot, was well exem-plified in the case of Dame Winnie, the dam of Palo Alto and Gertrude Russell. The last-named is a thoroughbred in appearance and generally one in action, as it was ordinarily the case that when brought on the track to be worked as a trotter she would gallop fifteen or twenty miles before she could be made to strike the gait at which it was desired to handle her. In other words, Gertrude Russell took after her dam, the running-bred mare, while her brother Palo Alto took after their common sire, the trotting-bred trotter Elec-tioneer. Rowena, the daughter of a 2:20½ trotter, is a great two-year-old, her record of 2:19½ being the fastest ever made in a race by a trotter of her age, but we can not see that her remarkably good performances at the trot can by any ordinary process of reasoning be attributed either to the fact that she is out of a thoroughbred mare, or the further fact that the dam of her sire was likewise a thorough-bred. On the contrary the only conclusion which can be reached by a logical mind in the consideration of Rowena's pedigree is that beginning with Electioneer, that horse, by reason of his intense impressiveness as a sire especially in the line of action-controlling, suc-ceeded in siring a level-headed trotter from a thoroughbred mare, and that this trotter in turn imparted his speed to a daughter who

Digitized by Google

was also running-bred in the maternal line.

In other words the blood of the trotting-bred Electioneer wiped out that of the running mare which produced Azmoor, and the trotting blood of the trotter Azmoor in turn overcame and nullified the running blood of the dam of Rowena. There is nothing particularly remarkable about this, as it is almost the universal experience in the breeding of any type of animals that a certain strain of blood will often overcome all other strains with which it is sought to be blended, and the blood of Electioneer is in this respect phenomenal. If no other two-year-old trotter had approached the performance of this filly Rowena, who carries eighty per cent. of running blood, there would be some ground for the contention that it was the thoroughbred strains in her pedigree which gave her unusual speed at the trot at an early age, and enabled her to carry that speed for a mile; but we find that some intensely trotting-bred two-year-olds have also beaten 2:20, and far eclipsed the 2:19½ performance of Rowena. For instance here are a few of them:

NAME.	Record.	Sire.	Sire of Dam.
Arion	2:10¾	Electioneer	Nutwood, 2:18¾.
Monbars	2:16¼	Eagle Bird, 2:21	General Knox, 2:31½.
Ralph Wilkes	2:18	Red Wilkes, 2:40	Mambrino Patchen.
Sabledale	2:18¼	Sable Wilkes, 2:18	Nutwood, 2:18¾.
Lena Wilkes	2:20¾	Guy Wilkes, 2:15¼	Arthurton.
Silicon	2:20½	Wilton, 2:19¾	Hambrino, 2:21¼.

This list of what may be called intensely trotting-bred two-year-old trotters that have made performances that are as creditable as those of Rowena, not only shows that near crosses of thoroughbred blood are unnecessary for the production of a phenomenal two-year-old trotter, but it also demonstrates beyond the possibility of a doubt that these baby trotters get their speed at the trot from their trotting sires and trotting-bred dams, inasmuch as six of the seven two-year-old trotters in the above list are by sires with records better than 2:30, and the other is by Electioneer, a horse that could speed a 2:16 gait. More than this the dam of Arion, the fastest two-year-old trotter in the world, is not only by a horse with a record of 2:18¾, but sister to a couple of trotters with records of 2:16½ and 2:21 respectively. Monbars, the next one on the list, is out of a mare with a record of 2:18¼, and her sire had a record of 2:31½. The dam of Ralph Wilkes is by the brother of Lady Thorne, a 2:18¼ trotter, and so it goes. The advocates of close crosses of thoroughbred blood in trotting pedigrees will have to produce a few trump cards of another variety than that exemplified by Rowena before their arguments will have much weight. "It is a poor rule that won't work both ways" is a familiar axiom.

If running blood is of so much value in the female line of a trotter's pedigree, why is it not of equal potency in the male line? Why not show us a first-class trotter by a thoroughbred sire, and out of a trotting-bred mare? Or, better still, give us one that is strictly thoroughbred.

The Developed Sires.

THE list of developed sires whose get have entered the 2:30 list this year in greater or less numbers continues to grow and its publication is the most convincing argument that could be made of the value of developing the speed of horses from whom it is intended to get trotters. At the present time the list is as follows, the record of each horse following his name, while in another column is given the number of his get that have entered the 2:30 list as trotters or the 2:25 list as pacers this season.

Name.	*Record.*	*New 2:30 Performers.*

Viking	2:19¼	1
Whips	2:27½	1
White Line	2:30	1
Wilkes Boy	2:24½	1
Wilkeswood	2:23½	1
Wilkie Collins	2:30¼	1
Wilton	2:19¼	5
Woodnut	2:16½	1
Young Fullerton	2:20¾	1
Young Wilkes	2:28¼	4

Up to the 20th of September the get of 389 stallions had entered the 2:30 list this season and of this number 155, or considerably over forty per cent. are developed sires, as shown by the above list. It will be noted also that many of the fast young stallions of the day are represented this season for the first time. Axtell is the most prominent of these. Other remarkably fast stallions whose names also appear above are Stamboul, Nelson and Palo Alto, the latter champion of the world at the time of his death, while Nelson went into winter quarters last season with the best stallion record on an oval track. It is also true, as any one may see by glancing over the list given above that nearly all of the prominent young stallions of to-day have fast records, and in the matter of producing speed that shows itself at an early age the developed horses are also far in the lead, as witness Guy and Sable Wilkes, Sidney, Alcazar, Shadeland, Onward and others.

Digitized by Google

Notes and News.

ULEE WILKES, that recently made a record of 2:23 against the watch, is a full sister to the great young sire Sable Wilkes, 2:18, as a three-year-old, and as she is now only four years old the chances are that with further handling she will beat 2:20, and may do the trick this season before starting for California again. Leo Wilkes, that is a brother to Sable and Ulee Wilkes, has also entered the 2:30 list out in California with a mile in 2:29¾.

THE little brown mare Kit Curry, that was quite a card down the Grand Circuit a few years ago by reason of the peculiar way in which her driver, an old man named Kyger, handled-himself in the sulky, has been retired to the broodmare ranks. She has a record of 2:18½.

THE dam of the pacer Chapman, 2:19½, has been bred back to St. Omer, the sire of that horse, in the hope of getting a brother or sister to the member of the 2:20 list.

KENTUCKY UNION, that is by Aberdeen and out of the old-time trotter, Kentucky Central, that has a two mile record close to five minutes, was sold at the dispersal sale of the Fairlawn horses in 1888 for $525.

LADY RUSSELL, sister to Maud S., now has three representatives in the 2:30 list and is consequently a member of the Great Broodmare table.

ANOTHER recent instance of the interchangeability of the trotting and pacing gaits is Boone Wilson, which horse has a trotting record of 2:20½ and a pacing mark of 2:26.

THE pacer Budd Doble, 2:13½, by the trotter Indianapolis, 2:21, has been going well over the half-mile tracks down East, recently stepping a mile at Ansonia, Conn., in 2:16½.

THE fastest yearling in Canada this season is Altoner, a son of Sphinx, 2:20½.

ASHLAND WILKES, a son of Red Wilkes, that is owned in Kansas, recently reduced his record to 2:19¼.

PATSY CURTIS, that was quite a sensational two-year-old trotter and that is now four years of age, took a race mark of 2:16½ in Kansas recently.

EGYPTIENNE, that won a race at Columbus Ind., recently, making a record of 2:19¾ in the third heat, is a sister to the Mambrino King mare, Henrietta, 2:17¼.

THE pacer Emma, 2:16¼, by Egbert, has been retired from the turf and will be bred to the Onward stallion, Acolyte, 2:21.

PRINCE M., 2:19¼, that was trotting in $10,000 stakes last season, is doing the Canada free-for-alls this year, and is proving very successful.

THE two-year-old pacer To Order, that has made a record of 2:26¼ this season, received his name from the fact that he was bred for a pacer, being by Thistle, 2:14, and out of Maud, 2:20.

IT is explained that Celerrina, a name given a daughter of Happy Medium that recently took a record of 2:19¼, means "The Swiftest."

MARTHA Wilkes, 2:08, is the dam of three foals; Pickpania, 2:14¼ of two, and Mary Marshall, 2:12¾, of one before being worked for speed.

AMONG the horses to be disposed of at auction in Kentucky this month is Mascot, that was bought by the western mining millionaire, Marcus Daly, for $26,000 in New York a few years ago.

THE old pacer Bawley reduced his record to 2:15 at Decatur, Ill., not long ago.

ABOUT the best race nag at the California meeting this season is Richmond Jr., a trotter that was brought East a few years ago to perform only indifferently well. He is now trotting as gamely as could be asked, and won a race at Sacramento in 2:15, 2:17, 2:16. Another good one that has stepped out in California is Aster, a son of Kentucky Prince, that up to last spring was used as a work horse. Now he has a record of 2:16, and several races to his credit.

SEVEN of the three-year-old trotters and pacers that have beaten 2:20 this year were bred in Kentucky.

YUBA, that has a record of 2:24½, and that is by Harold, and out of the famous broodmare Yolande; she by Belmont, dam Young Portia (a member of the Great Broodmare list), is now herself a producer, her son Yarmouth having recently made a record of 2:25¾ at Lexington. He is a four-year-old, and the first of the get of Sandwich to enter the 2:30 list.

REFERRING to the ex-championship of Sunol, a contemporary puts the facts rather flippantly when it says: "The moss is gathering on 2:08¼."

Digitized by Google

AMONG the recent deaths of trotters is that of Versailles Girl, 2:25¼, a daughter of Stephen A. Douglas. She was foaled in 1870, made her record as a seven-year-old, and was in foal to Bellman, 2:17½, at the time of her death.

CALHOUN, a son of Pilot Medium, that has a record of 2:24¾, but that has shown the ability to go in 2:15, if only an ailing leg would stand work, recently worked a mile in 2:17 over the Washington Park track, Chicago, but pulled up so lame that he has been thrown out of training.

THE most notable record breaking among the trotters recently was done by the Hamlin double team, Belle Hamlin and Honest George, they trotting in 2:12¼ at Providence, September 24, hitched to a pole sulky with pneumatic tires. On the same day the five-year-old stallion Kremlin, that is owned by the Allen farm at Pittsfield, Mass., won a great race in the stake for 2:20 horses, as after Constantine had captured the opening heat in 2:13¼, Kremlin took the next three in 2:13½, 2:12¼, 2:11¾. Of course this performance of Kremlin breaks the race record for five-year-old stallions, and there can be no question that the Allen farm stallion is a remarkably fast trotter as well as a grandly bred horse, and that he is game to the core was shown by his taking a fifth-heat record of 2:22¼ as a three-year-old when trotting against aged horses. But this race between Constantine and Kremlin shows what a remarkable advantage the pneumatic sulky is to certain horses, and while it of course does not make them trot any faster—that is, it can not add to their natural trotting speed—still, the absence of friction enables the horse to show at his best, which is of course the point to be desired. Kremlin is certainly bred for a trotter as he is by Lord Russell, brother to Maud S.; dam Eventide (dam of Evermond, 2:24¼, and Erin, 2:24¾), by Woodford Mambrino, 2:21½; second dam Vara (dam of the well-known sire Vatican, 2:29¼), by Rysdyk's Hambletonian. It will be noted that Kremlin gets two direct crosses to Hambletonian, one through his sire and another through his second dam, while on the other side of his pedigree is the stout blood of Woodford Mambrino, a horse, that when well along in years trotted some wonderfully game races and made performances that are equal to a 2:16 record at the present day. More than that, the blood of Woodford Mambrino has proven itself potent in the right direction—that is, by producing racehorse trotters. Constantine, who took a record of 2:13¼ in the first heat of Kremlin's race, is by Wilkes Boy, 2:24½, dam by Mambrino Patchen. He made a four-year-old record of 2:19¾ at Independence last season and has reduced it in such a marked degree as to show him one of the fastest young trotters in training.

MENTION has heretofore been made in these columns of the fact that Adelaide, 2:18, is proving a good broodmare, her first foal, Adelaide McGregor by Bonnie McGregor, 2:13½, having entered the 2:30 list as a two-year-old. At a recent trotting meeting at Butte, Mont., Adelaide McGregor trotted in the 2:26 class, winning the second, third and fourth heats in 2:23¼, 2:20 and 2:28¼. A third heat in 2:20 is a good enough performance for any three-year-old, and as Adelaide's only other colt that has been broken to a harness—Adelaide Simmons, by Simmons, 2:28—won a stake for two-year-olds at the Butte meeting, trotting the second and third heats in 2:39, 2:37, and beating among others the highly-bred colt W. W. Dixon, it is evident that Adelaide's blood is breeding on in grand style. Adelaide was a good race mare, her mark of 2:18 being taken in a race where she trotted two heats in that time. More than this, she was quite a colt trotter in her day, being one of the first three-year-olds in this part of the country to make a public appearance in races, and win. It was September 12, 1881, that Adelaide made her first start it being at Chicago in a race for three-year-olds. She beat True Blue and Phantom in 3:09, 2:55, 2:59, a rate of speed that at the present day would cause its owner to be double-distanced in a three-year-old stake open to the northwest. W. W. Dixon, that was Adelaide Simmons' opponent in this race, winning the first heat in 2:40, is by Nutwood, 2:18¾, and out of the famous trotting mare Fanny Witherspoon, 2:16¼, and two-mile record 4:43. Dixon is owned by Marcus Daly, the California copper mine magnate, who, by the way, says he is going to quit trotting his horses, preferring the plan of selling everything as yearlings.

PICKPANIA, that was the best horse in Miller's stable, has gone lame.

THE dam of H. C. T., 2:17¼, is in foal to Temple Bar, 2:17¾.

Digitized by Google

THE miserable fiascoes that have been the most prominent feature of certain trotting meetings this season, the associations failing to pay the purses when the time for settling with horsemen arrived, has no doubt, taught some people the folly of expecting to draw a large attendance at trotting meetings held far away from centers of population. It is in the west alone that this mistake of giving rich stakes for trotters and pacers, making the conditions such that a large attendance was necessary to insure financial success, has been practiced. The latest failure to settle when the meeting ended was at Richmond, Ind., and in that case it appears to have been a bunko game, as horsemen were required to pay all entries in cash, while not one cent was given up by the treasurer to the money winners in races. Of course this was robbery, pure and simple, and should be punishable by imprisonment in the penitentiary. At Grand Rapids and one or two other places where the associations failed to meet their bills there was at least an honest effort to pay out all the money taken in, but at Richmond the treasurer of the track disappeared and with him went not only the unpaid purses but the money paid in by horsemen in stakes, which, of course, so far as the association was concerned was simply a trust fund. There is no doubt that the success in 1891, of the kite track at Independence, Iowa, deluded a good many people into the belief that all that was necessary to make money with a race track was to build one of the kite pattern, put a fence around it and advertise some big stakes. The residents of Sturgis, Mich., tried this to their sorrow, but they honorably paid every dollar that was offered. Other kite tracks in the northwest have lost money this season, that at Kankakee, Ill., being a case in point. It is all well enough for the men in every community who are interested in the trotting horse to band together for the purpose of building a good mile track, and in nearly every instance it will be found that the promoters of such an enterprise will be well repaid for their investment by the opportunity which is afforded them of developing their trotting-bred stock. But to imagine that a paying race meeting, one in which thousands of dollars are given away in purses, can be maintained every season in small cities, is a mistake.

AN eastern correspondent of the *Chicago Horseman* tells how the trotter The Bull, that has been quite prominent in the east this season, making a record of about 2:25, came to receive his peculiar name. Says he: "Old turfites will remember that William B. Smith, of Hartford, Conn., often selected the tall Narragansett trainer Tom Carpenter to pilot his favorite black stallion Thomas Jefferson to victory, and occasionally Tom's brother George Carpenter would sit behind the horse in his races. George was of such a stubborn temperament that his associates frequently called him 'The Bull.' Away back in the sixties William B. Smith traded with old Ad Carpenter for a handsome, big, high-bred looking bay mare, Irene, by Dallas, the thoroughbred sire whose colts used to fill with admiration his owner, George E. Waring, of Newport, R. I. Mr. Smith bred Irene to Jack Sheppard, the produce being a mare he called Shepherdess. This mare he bred for several years to Thomas Jefferson and produced Tom Carpenter, 2:23½, and The Bull, 2:30, named in remembrance of the two brothers."

ONE daughter at least of Green's Bashaw will go down in trotting history as a wonderful producer. Bashaw Belle is the dam of Strong Boy, whose pacing record of 2:12 was the best by a four-year-old at the time it was made; None Better, 2:23¾, a sister to Strong Boy; Secure, 2:30, and Carrie 2:29¾, she in turn producing Manager, champion two-year-old pacer with a record of 2:16½, and who subsequently paced in 2:11½ as a four-year-old, and now has a record better than 2:10.

THE grandam of Midnight Chimes, 2:16¼, is owned by J. C. Hoge, Mt. Pleasant, Ohio. He has a fast colt by St. Bel out of her.

THE three-year-old Guy Wilkes filly Siva, that made a record of 2:24½ at Lansing, Mich., not long ago, is a sister of the pacer Rupee, 2:14½, and also to the young stallion Golden Gateway that is owned by Mr. C. J. Hamlin.

THE gray colt, Bob Frost, that is by Independence, 2:21¼, and out of Kate Sprague, 2:18, recently stepped a mile over the Cleveland track in 2:28¾. He is owned by Mr. J. D. Rockefeller, who some years ago took quite a fancy to fast horse flesh, but of late has not done much in that line.

THE three-year-old filly, Christo Queen, by Monte Christo, dam by Standard Bearer, recently went a mile in 2:22½ at Lexington.

A SISTER to the pacer Chapman, 2:19½, was foaled in Ohio recently.

Digitized by Google

AFTER the sensational race trotted by Krem- at Providence, September 23, the Allen rm management made public through a al paper some interesting facts in regard to best three consecutive heats to the credit trotting stallions where such animals had ne that number of miles below 2:15 in a ce. To the close of 1891 a race record aver- ing three heats below 2:15 had been made but three horses, viz.: Nancy Hanks, Del- arch and Allerton. This has been beaten rteen times during the present season, and t there are only three five-year-old stallions titled to this honor. They are Kremlin, nce de Leon and Allerton, and in respect of ce performances they stand as follows:

REMLIN, b h, foaled 1887, by Lord Russell, brother of Maud S., 2:08¾; dam Eventide, by Woodford Mam- rino, 2:21½. September 23, 1892, Narragansett Park, Providence, R. I., six starters. Time, 2:13¼, 2:13½, 2:12¼, 2:11¾. Average time of four heats, 2:12 3-5. Average time of Kremlin's three winning heats, 2:12½.

NCE-DE-LEON, bl h, foaled 1887, by Pancoast, 2:21¼; dam Elvira, 2:18½, by Guyler. September 6, 1892, Fort Wayne, Ind. Five starters. Time, 2:13, 2:14, 2:15¼. Average 2:14.

LLERTON, b h, foaled 1886, by Jay Bird, son of George Wilkes; dam by Mambrino Boy; g d by George Wilkes, October 14, 1891, Lexington, Ky. Match race with Delmarch. Time, 2:13¼, 2:15, 2:15¾. Average, 2:14⅔. Allerton has a record against time over the Independence kite track of 2:09¼, but this is his fastest race record.

In addition to holding the world's five-year-d stallion trotting race record, 2:11¾, and ree heats averaging 2:12½, Kremlin is also inner of the fastest four-heat trotting race d record over a regulation track, the average me of the four heats being 2:12 3-5.

It has been apparent in all the trials of Nan- Hanks against the watch during the present otting season that at no time has the great aughter of Happy Medium been fully ex- nded, because, so intense is the conservatism f Mr. Doble in such matters, he would sooner iss the chance of a world's championship an risk injury to a priceless piece of horse esh. But although it seemed to many that the val track record of 2:07 made by the mare at t. Paul not long since was capable of reduc- on by her, not even the most enthusiastic and ptimistic of trotting-horse admirers imagined hat before this season closed the trotting mark ould be 2:04, and on an oval course. And yet Nancy Hanks accomplished this feat at Terre Haute, September 28. The day and track were erfect and the mile phenomenal in every re- pect, one of the quarters, the third, being rotted in 29¾ seconds, a rate of speed never efore attained by a trotter. Here is the time y quarters:

First	31
Second	31¾
Third	29¾
Fourth	31½
Mile	2:04

This tells the whole story. Doble was carried to the judges' stand by the people, who cheered till they were hoarse, and it was a jubilee all around. And it was deservedly so. The equal of Nancy Hanks as a trotter has never been seen, while as a driver Mr. Doble stands pre-eminent and is no less liked for his personal qualities than his skill as a trainer and reinsman. Nancy Hanks has done more than he claimed for her. She is a triumph of breeding, and especially is her work a credit to the Hambletonian blood, both her sire and the sire of her dam—Happy Medium and Dictator—being sons of that horse. On the same day that Nancy Hanks trotted the stallion Monbars, that as a two-year-old made a record of 2:16½, started against the three-year-old stallion record, the 2:12 of Axtell, also made over the Terre Haute track, and lowered it by a quarter of a second, the quarters of the mile being 33¾, 33½, 32½, 32, a remarkable even mile and a strong finish. Monbars is by Eagle Bird, 2:21; dam Lady Maud, 2:18¼, and is therefore a good exponent of the developed-sire-and-dam idea. Wilkes and Gen. Knox are the leading strains in his pedigree.

THE first brothers to sire 2:15 trotters are Guy Wilkes and William L., and Leland and Arthurton. It is a curious coincidence also that a good many of Guy Wilkes' best trotters are out of Arthurton mares.

THE get of Gibson's Tom Hal have twice held the pacing record, Little Brown Jug and Hal Pointer being the standard bearers.

ELECTRO BENTON, a stallion that is bred like Sunol, being by Electioneer and out of a General Benton mare, took a record of 2:25 at Maysville, Ky., not long since.

JOSIE KING, that is by The King, a son of George Wilkes, and out of the dam of Constantine, 2:13¼, recently took a record of 2:29¼ in Kentucky.

THE two-year-old filly, Avena, the first of the get of Palo Alto, 2:08¾, to enter the 2:30 list, is out of a mare by General Benton, second dam by Kentucky Prince.

THE Electioneer stallion, May King, 2:23½, that is out of the old-time trotter May Queen, 2:20, will start at Lexington this fall for the purpose of lowering his record.

Digitized by Google

THE gray gelding, Darbee, that won a seven-heat race at Great Falls, Mont., not long since, taking a record of 2:24¼, is by Almonarch, 2:24¾, making the eighth of the get of that horse to beat 2:30, not one of them being out of a standard bred mare.

THE pacer Chris Smith, that is by the trotter Guy Wilkes, 2:15¼, and out of the old-time pacer Lucy, 2:14, recently won a heat in 2:22½ out in California, thereby making his dam a member of the great broodmare list, she having also produced Lucyneer, that as a three-year-old last season made a record of 2:27.

Volume XI

Is now ready for delivery. It contains the pedigrees of all standard stallions from 16382 to 19801 inclusive, standard mares and geldings, and the usual department of non-standard animals. Is bound uniformly with Volume X and preceding volumes, and is sold at the reduced price of $5, postage paid.

Volumes I and II are out of print, but all the standard animals are registered in the succeeding volumes. Volumes III to XI, inclusive, in one order, $40.

Send P. O. order or New York or Chicago draft with order, as books are not sold on credit.

Send order and draft to American Trotting Register Association, Lock Box 4, Chicago, Ill.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal.* The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ABILITY, (6) b m foaled 1892; by Prince Jerome 6834; dam Ella Goodell, by Almont Jr., 1829; g d Caulkins Mare, by Damon 1987. [See Ella Goodell, Vol. VIII.] Bred by G. M. & F. H. Morton, Chicopee Falls, Mass. [Vol. XII.]

ACTRESS, (6) b m foaled 1886; by Alcantara 729; dam Camille, by Daniel Lambert 102; g d Doane Mare, by Young Columbus 95, etc. [See Camille, Vol. V.] Bred by R. L. Rose, Providence, R. I. [Vol. XII.]

ALCAROSE, (6) ch m foaled 1888; by Alcantara 729; dam Camille, by Daniel Lambert 102; g d Doane Mare, by Young Columbus 95, etc. [See Camille, Vol. V.] Bred by R. L. Rose, Providence, R. I. [Vol. XII.]

ANGELICA, (6) b m foaled 1889; by Alcantara 729; dam Camille, by Daniel Lambert 102; g d Doane Mare, by Young Columbus 95, etc. [See Camille, Vol. V.] Bred by R. L. Rose, Providence, R. I. [Vol. XII.]

ARLENE CHASE, (7) ch m foaled 1892; by Pickering 3094; dam Harbina, by Harbinger 1899; g d Black Bess, pedigree not traced. Bred by Charles A. Chase, Carmel, Me. [Vol. XII.]

ARMOUR MAID, (6) ch m foaled 1892; by Vyzant 11114; dam Maggie W., by Exile 1143; g d Mollie L., by Alar Clay 706, etc. [See Maggie W., Vol. IX.] Bred by Rufus Walston, Rolfe, Iowa, foaled the property of Peter Haspers, Armour, S. Dak. [Vol. XII.]

ARTHENA, (6) b m foaled 1882; by Arthurton 365; dam Belle Thompson, by Alexander 490; g d Belle Brown, by Hambletonian 725, etc. [See Belle Thompson.] Bred by Ben E. Harris, passed to G. A. Pope, San Francisco, Cal.; then to F. C. Talbot, San Leandro, Cal. [Vol. XII.]

AURIOL 19895, (6) b h foaled 1891; by William M. Rysdyk 5703; dam Nelly, by Champion King 4855; g d Effie G., by Greyhound 154, etc. [See Nelly.] Bred by Henry Peterson, Lodi, N. Y., passed to Freeman I. Lott, Montrose, Pa. [Vol. XII.]

BELLNA, (6) b m foaled 1891; by Shadeland Onward 6010; dam Bellena, by Satellite 2500; g d Belle, by Washington Hambletonian 334. [See Bellena, Vol. VI.] Bred by E. D. Gould, Fullerton, Neb. [Vol. XII.]

BOURBONITE 20299, (6) b h foaled 1888; by Bourbon Wilkes 2345; dam Mary Turner (dam of Red Rover, 2:28½), by Westwood 2363. [See Mary Turner.] Bred by Miller & Turner, Paris, Ky., passed to A. A. Swearingen, Mendota, Ill., then to W. V. E. Steel, Dixon, Ill. [Vol. XII.]

BOURBON JIM 19947, (6) b h foaled 1882; by Bourbon Wilkes 2345; dam Nelly R. (dam of Monroe Wilkes, 2:24¾), by Jim Monroe 835. [See Nelly R.] Bred by I. N. Sims, Attica, Ind., passed to William Fisher, Columbus, Ind., then to J. B. Curtis & Sons, North Vernon, Ind., then

Digitized by Google

to Charles H. Wright, North Madison, Ind., then to D. B. Greathouse, N. S. Greathouse and T. D. Rutledge, then to T. D. Rutledge, Lewisport, Ky. [Vol. XII.]

AR BORGIA 20569, (6) ch h foaled 1891; by Prince Eugene 9621; dam Roxie, by Mambrino King 1279; g d Lady Barnes, by Hamlin Patchen 3519, etc. [See Roxie, Vol. IX.] Bred by William H. Fearing, Jobstown, N. J. [Vol. XII.]

lo .02, (10) b h foaled 1890; by Civilization 5807; dam *Minnie K.*, 2:18¾, by Billy Cone, said to be a son of Flying Morgan 2936, etc. [See Minnie K.] Bred (at Woodstock, Ohio) by S. P. Kimball, passed to N. M. McDaniels, Dallas, Ore., then to Holmes & Key, McCoy, Ore. [Vol. XII.]

ONEL COAST 19809, (6) b h foaled 1890; by Cuylercoast 5800; dam Dolly, by William M. Rysdyk 5703; g d Nell, by Seneca Chief 278, etc. [See Dolly.] Bred by Jacob Meeker, Lodi, N. Y., passed to W. L. Eastman, Ovid, N. Y., and D. A. Johnson, Dundee, N. Y. [Vol. XII.]

STER ROSE, (6) b m foaled 1892; by Rosemont 15200; dam Julia, by Tattersall 299; g d Julia, by Morrill 850 etc. [See Julia Vol. X.] Bred by P. H. McCall, Petrolia, Ont., Can. [Vol. XII.]

TH P., (7) b m foaled 1890; by Vic Monroe 8545; dam Sadie P., by Little Wonder 1304. Bred by William L. Peed, New Castle, Ind. [Vol. XII.]

IE COLES, (7) b m foaled 1890; by Forseti 9264; dam Jenny Patchen, by Admiral Patchen Jr. 4890; g d Nell, pedigree not traced. Bred by W. W. Coles (at Lansdowne, Pa.), Kokomo, Ind. [Vol. XII.]

ORENCE BLACK, (7) gr m foaled 1892; by C. P. R. 15851; dam Sis Lee, by Abdalbrino 2646; g d Early Bird, pedigree not traced. Bred by John O'Donnell, Covington, Ky.; passed to John A. Sroufe, Dover, Ky. [Vol. XII.]

ZEL WOODNUT, (6) ch m foaled 1892; by Woodnut 5334; dam Myrtle, by Nil Desperandum 1389; g d Kentucky Heiress, by Kentucky Prince 2470; g g d Heiress (dam of Foxie, 2:28½ and Nightingale, 2:28¾), by Abdallah 15 etc. [See Myrtle, Vol. IX.]. Bred by Robert Steel, Philadelphia, Pa.; foaled the property of M. B. Richardson, Lime Rock, Conn. [Vol. XII.]

HAYWORTH 19957, (6) b h foaled 1890; by Hannis 821; dam Dolly (dam of *Mambrino Hannis*, 2:16½), said to be by Patrick Henry (Preston's). [See Dolly, Vol. X.] Bred by William H. Whitridge, Baltimore, Md. [Vol. XII.]

HELENE CHASE, (7) ch m foaled 1891; by Pickering 3094; dam Harbina, by Harbinger 1899; g d Black Bess, pedigree not traced. Bred by Charles A. Chase, Carmel, Me. [Vol. XII.]

HERNDON 20582, (6) br h foaled 1891; by Pagan 2077; dam Victrix, by Charley B. 812; g d Vic by George Wilkes Jr. 20238, etc. [See Victrix]. Bred by J. D. Thomas, Ovid, N. Y. [Vol. XII.]

A. McFADDEN, Portland, Maine.

Columbia Pneumatic Tires

..ON..

SULKIES

are the ones that win the races, saving 2 to 4 seconds to the mile.

Elliott hickory wheels and ball bearings contribute their share to this remarkable work, as well as the famous Columbia Bicycle Tires.

The new sulky is the topic of the day, and the horsemen are straining every point to obtain possession of one. I have had 20 offers for mine, and every one else that got in early is envied. They are simply a wonderful invention, and are bound to revolutionize racing.
Allen Lowe, in Boston Globe.

Price of wheels complete with tires, bearings and forks, axle socket, ready to be fitted to sulky.....*$100 00*

JOHN MORRIS COMPANY, Printers, 118 & 120 Monroe St., Chicago.

WALLACE'S MONTHLY.

VOL. XVIII. NOVEMBER, 1892. No. 9.

Entered according to Act of Congress, in the year 1891, by AMERICAN TROTTING REGISTER ASSOCIATION, at Washington, D. C.

TERMS: TWO DOLLARS PER ANNUM. SINGLE NUMBER, TWENTY CENTS.

THE METHODS OF PALO ALTO.

BY S. T. H.

VIII.

THE first anniversary of the colt's existence at Palo Alto is the date of his being led from the kindergarten to the breaking stables. The primal restraint the yearling feels beyond the halter is the bitting rigging. For several days he is led until he becomes accustomed to this subjugation to the harness. Nothing more unconsciously enables him to break himself than to be placed in the paddock with the side line check of the bitting rigging just taut enough to make him feel that he is subject to a control which he can not possibly overcome, no matter how restive may be his opposition. It not only educates the muscles of his head and neck to the control of the bit, but makes his obedience so complete, that, within a few days, he will follow the trainer around the paddock and come willingly at his call. Then he is ready for the next lesson. Long reins are now attached to the bridle rings, and he is carefully driven by his trainer walking behind him, up and down the long lanes and about the open spaces in front of the stables, until he will turn at the touch of the rein, and stop and advance at the word of command. When thus perfectly under control, the regular driving harness takes the place of the bitting rigging, and he is hooked double with a reliable, perfectly broken horse. This instruction is continued until his breaking in double harness is complete. The colt is driven first upon one side and then upon the other, until he will turn or advance, stop, walk or trot, with the steadiness of his matured mate. This system of double breaking first differs from that adopted on the majority of the stock farms. Experienced horsemen often claim that single breaking, in the first instance, completes at once the entire routine of subjugation. They assert that if the colt is thoroughly broken to single harness, he will go, as a matter of course, when hooked with a mate; but that the reverse does not follow, for, very frequently the colt broken to go double, has to be broken over again to work single. Why not, therefore, they query, break the colt to single harness in the first instance? The response of Palo Alto is: that double harness supplies the means of greater confidence in the mind of the colt, with less danger of accident. The colt is exceedingly imitative. If his mate starts, and turns, and stops at command, the colt soon learns the lesson from example as well as from the assistance given to him by the voice and reins of the trainer. This is the crucial period in the colt's education. Kindness, firmness and caution at this critical time means a steady, reliable, well-broken colt. Harshness, cruelty, temper or carelessness, on the part of the trainer then induces either a nervous, frightened, stubborn, sulky, morose, revengeful, or peevish disposition in the colt that may require years of remedial treatment to overcome, and even then the cure may not be perfect. For these reasons the Palo Alto management prefers double breaking as the initial method and their experience leads them to the

Digitized by Google

conclusion that, after being well broken to double harness, the dangers of single breaking are thereby reduced to the minimum. He is then broken single. Very rarely does he show much opposition, but after perhaps a few moments of restiveness or one or two false starts because he misses his mate, he yields to the caresses and kindly words of his breaker and moves off with very little, if any, protest. Two or three lessons in single harness and he becomes accustomed to it to such a degree that forever afterward, unless he is unusually nervous or high strung, he takes it as a matter of course. Indeed there is more difficulty with a rebellious yearling, of the Sunol type, *to break perfectly to stand* while being hooked to the sulky, than in walking or trotting after the harness is buckled and ready for the start. At all events the colt is kept in the breaking stables till his education in single as well as double harness is completed. During the last few weeks of his breaking he is given quite an amount of work, not of speeding but of sufficient effort to develop and harden his muscles, to season and strengthen his tendons, and to brace and fortify his general condition, until he is in readiness to be advanced to the training stables, for the development of his trotting speed. Remember the colt is only now one year old, yet he has had four months of constant handling in the kindergarten and breaking stables, with such an allowance of generous diet and careful grooming, all powerfully aided by the equable climate of California, that, in the growth of his frame and the fullness of his muscular system, the yearling colt at Palo Alto approximates to the form and speed of a three-year-old in the higher latitudes of this country, where it is freezing weather four or five months in the winter season, and he is not broken to harness until three years of age. Everything that science and ingenuity can devise to promote growth and early maturity, coupled with the perfection of condition, has thus been done to fit the colt to begin his speed lessons on the very first day that he comes into the trainer's hands. His walking and jogging and preliminary work have been completed. He is now to receive the great impulse to speed with all of his mental and physical energies concentrated on the trot. He is taught that this must be the crowning ambition of his life. Already an advanced pupil from the kindergarten, it is astonishing how quickly he learns to forge ahead with steady, resolute, yet tremendous strides on the trot. The correlative lesson, impressed upon him at the same time is that pacing or galloping is nothing less than high treason in trotting horsehood. All his preliminary work, both in the kindergarten and the training stable, has been performed in bare feet. They have simply been dressed to a level and the lower edges rounded so as to prevent splitting or breaking, thus leaving them in good condition for shoes when the proper time comes. When his track work begins, then, and not before, his feet are armed with light plates. These shoes invariably weigh six ounces in front and three ounces on each hind foot. The work, in the kindergarten and breaking stable, has put him in prime condition for speeding.

The rules, laid down for developing speed at Palo Alto, are as despotic as the laws of Draco. They can be thus enumerated and summarized.

First: When horses are in condition for speed, jogging is discontinued, as an useless waste of vital force.

Second: Condition and constitution and physical development must determine the amount of fast work to be given to each horse.

Third: The acquisition and development of trotting speed is best accomplished by driving up and down a certain portion of the stretch, short distances, urging the horse in some of these brushes up to a supreme effort.

Fourth: Exhaustion follows over-taxation. Over-taxation results in physical relaxation, which produces break downs. The horse must, therefore, always return from his work in high courage, with the ambition and capacity undiminished for full speed.

Fifth: Speed is the great desideratum. When the colt has acquired speed, then the distance of the brushes must be gradually lengthened, till the mental and physical powers, the muscular and lung capacities, are sufficiently developed

Digitized by Google

to enable him to carry his highest flight of speed the distance required by public performances. These series of rules will be a genuine surprise to the general reader. It has been tacitly concluded that the wonderful success of Palo Alto was largely the result of blind chance; that the extremely fortunate selection of Electioneer and the capacity to purchase successful broodmares, and the equally accidental good fortune in selecting the reinsman who guided the flying feet of the mighty Smuggler, were the main features in this marvelous lottery of luck that made the triumphs of Governor Stanford so exceptionally brilliant and uniform. But the reader who has carefully followed his profound methods of selection of both sires and matrons, upon physiological and psychical principles that can not be gainsaid, and his astute methods of educating the trotting capacity from weaning time to aged horsehood, will discern a commingling of science and empiricism, of philosophy and practice, of patience and skill, that is more profound and complete than all the older routine methods of the trotting horse breeders and trainers combined. Above the potency of Electioneer, and the capacity of Beautiful Bells or of Dame Winnie; superior to the patient skill of Marvin, and the winged feet of Sunol, is the genius of the man, who, in opposition to acknowledged authorities and established precedents, has founded the magnificent breeding establishment of Palto Alto, and conceived the laws for its management, in all of its details. For it now leads the trotting stock farms of the world in the quantity and quality of its trotting horse productions, even in the infancy of its career. These successes are the children of a mighty brain. They are not accidents, but the results of profound thought. The remaining practical methods to be considered are only in illustration of these reflections.

The colt, thus shod and conditioned, is hitched to a sixty-pound sulky. The first attention is given to his natural carriage even in harness. The check is so carefully arranged that he can carry his head, at the same elevation, as when trotting loose in the paddock, or swinging along at full speed in the kindergarten. The preservation of this angle, it is claimed, is the certain means of attaining and maintaining balanced action. It will be noted that no interference with this equipoise is made by shoes of varying weight. In all cases the hind shoes weigh three ounces less than the front ones, and this is precisely the relative difference in weight between the front and hind feet, with all their contents, in the green state, when both are dressed with reference to the proper length of the wall at the toe, and its normal height at the heel.

The colt is then driven to the back stretch of the course, where there are no gates out of which he can bolt, and no exciting incidents or objects to divert his attention. Then his speeding lessons on the trot begin in earnest. He is driven fast, at first, very short distances, not extending over one hundred yards in length. To avoid pulling on one rein, or carrying his head on one side, or acquiring the notion that he must speed only in one direction, he is driven up and down the same place. At the finish of each speed effort he is brought to an absolute standstill, in order that he may blow out and rest, both mentally and physically. During the intervals of speeding, the strain upon the tendons, up to this time unaccustomed to severe and sustained exertion, is tremendous. Mainly for their relief are these stops made imperative; for it has been ascertained that, by this system of brief taxation and relaxation, break downs are the most effectually avoided.

The colt can thus be given a great deal of speeding, not once or twice a week, according to the old method, but every day, without becoming stale or strained. By this method the colt learns to increase his speed with surprising rapidity. To insure against accident from striking he is well protected with boots. These short spurts are persisted in till the colt has acquired speed, as that is the great objective point to be attained. When he has learned to speed fast this short distance, with the evident strength and courage to carry his greatest brush still further, the distance is then gradually increased till he is capable of moving an eighth and then a quarter of a mile.

Digitized by Google

When the speed for his age and period of development is satisfactory, he is kept up to that mark and the distance is lengthened, so gradually and patiently, that before he is aware of it he is able to cover a mile at a rate of speed approximating to his brushes on the back stretch.

The Palo Alto method appreciates the benefit of working the trotting horse in company. This requirement is imperative. From the very first attempt at speed, he is driven along side of another horse also to harness. This association promotes both ambition and steadiness; without which qualities, on the trotting turf, there can be no first-class race-horse. This increase of distance is never made at the expense of speed. But when the rate is assured, then just as much care is taken to cultivate the courageous staying qualities. Nothing more effectually conduces to that result than the gradual increase of the distance speeded. Beginning with an eighth the distance can be gradually increased an eighth of a mile at a time till even a faint-hearted horse can be disciplined to trot a mile and a half up to a rating gait. When the time is drawing near for his appearance in a public race, then the preparation changes. He is given more miles and repeats. At least twice a week he is driven three separate miles, the first one within ten seconds of his speed, the second within five seconds and the third mile up to his speed. In both the preliminary miles the last quarter is generally brushed as fast as he can trot. This work, in connection with repeated lessons in scoring at the send off of each heat, always in company, completes his tuition as a race-horse. On the intervening days he is worked at short distances, but always in some part of this short-distance exercise he is driven up to his speed.

The regimen of the colt or horse in training is regulated by his constitution and appetite. The rule is to give him all the nutritious food that he will digest. But if he is a glutton, and not only gorges his stomach, but takes on flesh that is too cumbersome for his fastest locomotion, the quantity given to him is determined by that amount which will keep him full of ambition for speed, and in strong staying condition. But neither colt nor horse is ever drawn for speeding; this exhaustive process is forever forbidden. Sweating by clothing and the usual walking exercise after work, at some later hour in the day, are avoided as a waste of vital force; but every means known to the trainer's art to repair the waste of muscles and stimulate the vitality, especially between heats of a severely contested race, are adopted that the science of hygiene justifies.

During all the stages of training the delicate sensibilities of the network of nerves that nourish the lips and mouth and face are preserved from injury as much as possible. Pulling, lugging and carrying the head on one side, are the evidences of a badly broken or a rebellious trotter. They are the prolific sources of hitching and hobbling, and interfering and breaking. The experience of the management of Palo Alto is that constant jogging teaches the ambitious colt to pull upon the reins. Moreover, it is one of its conclusions that pulling the weight by the mouth is not only injurious to respiration, but conduces directly to vital exhaustion. The proof of the accuracy of this conclusion is found in the fact that the horse with a light, elastic touch upon the bit is not only easier to control, but outlasts the puller with the same amount of speed. The whip, the scolding voice, loud with the execrations of blasphemy, the violent jerking upon the reins, indeed the entire curriculum of brute force, divorced from intelligence, as means of ill-tempered direction, are supplanted, at Palo Alto, by a guarded patience, a methodical kindness, and a studious consideration of the peculiarities and capabilities of each colt as he comes up from the kindergarten, through the breaking stables, to the trainer's hands for track honors.

The grand consummation to be attained is the production of the ideal trotting horse. Every means that science, and theory, and practice suggest, within the titanic grasp of unlimited wealth, in the selection of the parents, and the development of the produce, is promptly tested and adopted, unhindered by breeding precedents or editorial dogmas, provided it will furnish another advance step in

Digitized by Google

is great empirical enterprise, of produc- g the perfected American trotting rse.

The management is not insensible to lverse, wholesome criticism. Nor are l of its methods sufficiently perfected to be proof against the inevitable eak downs incident to colt training. he short, sharp, brush system of de- lopment is not yet so completely atured, as not to be obnoxious to the nsure of teaching horses to rush ahead, hen they reach the course, which makes em somewhat more ungovernable than hen they receive the customary jogging, d many slow miles, far within their pacity. To obviate this defect, the de- lopment of speed is made a distinct stem of instruction, and preparation r races another discipline, differing aterially from the first. In Mr. Marvin's ork on training the horse he gives the tails of work on the track, for an entire eek, of a horse, fast enough to trot a ile in two minutes and twenty seconds. o training is done at Palo Alto on Sun- ay, and this day, devoted to rest to both an and horse, it has been found, in no ay interferes with substatial progress.

On Monday the horse in training for cing purposes is jogged from five to x miles, at no time being permitted to peed.

On Tuesday he is jogged three miles, hich is considered sufficient to put him condition for more rapid work. The rotecting boots, which should always put on to guard against any possible cident, consisting of scalping and shin oots behind, and quarter with knee oots, and occasionally tendon and arm oots in front, are then buckled in osition, and the horse is given three or our sharp brushes of speed, each one eing a quarter of a mile in length.

On Wednesday the horse is again gged three miles. Then the boots are ut on and he is given a mile in 2:37 ith a repeat, after an interval of twenty inutes, four or five seconds faster.

On Thursday he is driven an easy gait f three miles, with no speeding at the inish.

On Friday the work is materially in- reased. He is jogged three miles, which liminary exercise is always essential when speed is to be demanded. Then he is given three or four fast quarters.

On Saturday the most earnest work of the week is exacted. He is warmed up by a brisk jog of two miles. Then he is called upon for a mile with three separate repeats, an interval of twenty minutes intervening between each mile.

The first mile should be trotted in about	2:40
The second mile in	2:30
The third mile in	2:26 or 2:28
The fourth mile in	2:23 or 2:25

Of course the horse after each heat must receive the best of care, but excessive body bathing, and leg washing and bandaging are avoided at Palo Alto as deleterious. This system teaches the horse that preparation for a campaign is entirely different from repeated short brushes to acquire speed. He is taught to jog, and brush, and score, and trot miles, and repeats, which routine he soon learns to follow, as methodically as if he had never been taught to brush, and yet when in the crisis of a race, the brush is demanded, the electric speed of the Electioneers always comes into play.

The kindergarten develops speed, lung capacity, and muscular power without the added danger of carrying the weight of driver and sulky. But these exemptions do not necessarily obviate break downs when the colt is put into regular training, however materially they may lessen them. For on page 167 of the same work Mr. Marvin records: "Norval was worked young, and was "one of our fastest colt trotters. I have "driven him quarters close to thirty- "three seconds, and in his two-year-old "form he was almost as fast as Palo "Alto. *But he went wrong, in a leg, "and we decided to give him a long rest."* On page 299 he continues: "We sup- "posed Palo Alto to have been broken "down, after his four-year-old cam- "paign. It was with fear and trembling "that we endeavored to train him last "spring (in his eight-year-old form). "Sallie Benton had a strained suspensory "ligament when she made her record of "2:17¾. Fred Crocker had a bad tendon "when he lowered the two-year-old "record to 2:25¼. Elaine gave way in "one of her rear flexor tendons, and "trotted her races with the tendon sup- "ported by a rubber bandage, about four

Digitized by Google

"inches wide, and five feet long, "wrapped about the leg and fastened "with a rubber strap. Bonita, too, "was a virtually broken-down mare be-"fore she was retired. *I could add to "the list many less noted cases.*" While, therefore, even the humane methods of Palo Alto may materially mitigate the early decay which early maturity inflicts, yet they can not entirely abrogate the existence of the law. The founder has conceived the most intelligent plan for thus robbing the law of its terrors in establishing the kindergarten. Moreover, he has mastered the literature and theory and practice of the subject, and brought to bear all the valuable aids that the constantly improving methods of protecting and developing the trotting horse present to his mind as practical. But he is uncompromisingly radical on the necessity of the kindergarten, the value of short, sharp, brushes, to attain speed, and the inestimable advantage of thoroughbred mares with level heads, out of the great racing families, where speed and stamina are in the ascendant, but always gifted with natural trotting action.

The preliminary success of the Palo Alto breeding establishment founded upon these principles is an earnest of their inherent merit. In the future the proprietor confidently predicts the production of the perfect American trotting horse upon the faithful application of these methods that his own brain has conceived. Above all other means for the production of the greatest trotting performers he depends upon the thoroughbred broodmare with the qualities above specified.

Whenever a powerfully formed thoroughbred mare from his extensive establishment is brought before him, with pronounced trotting action, he repeats with such an earnest frequency that it has become an axiom at Palo Alto: "*From that source will come the greatest American trotter!*" But he has never predicated, from this cross, the uniformity of trotting produce that must come from the trotting sire and the trotting dam. Their accumulated wealth of trotting inheritance must give to them a preponderance of trotting progeny. It is the province of the wealthy breeder to prosecute these experiments that might prove too expensive to men of more moderate means. While he might secure one Palo Alto by this course, he would obtain more Gilbreth Knoxes, or Henry B. Patchens, or Gen. Bentons, by the safer method of breeding trotters to trotters for the more uniform production of trotters. But this latter course does not exhaust the possibilities of improvement in the trotting horse. He came from the thoroughbred, and all through his career he has received mighty reinforcement, in both speed and stamina, from the thoroughbred. Kentucky is rich in trotting values from the Almonts, and the Wilkeses, and the Belmonts, and the Aberdeens, and the Dictators; but the turf authority who desires to witness the consummation of the perfect American trotting horse, can not close his mental vision to the fact that Almont's greatest trotter, Fanny Witherspoon, is out of a thoroughbred mare; that Belmont's greatest producing son, Nutwood, is out of a mare whose dam was thoroughbred; that Jay Eye See and Maud S., the champions of the turf in their day, were out of mares whose dams were likewise thoroughbreds, and that the association of extreme trotting speed and stamina with thoroughbred crosses is so intimate as to preclude the conclusion that the further infusion of thoroughbred blood is too chimerical to add still greater capacity to future first-class trotting performers. The brilliant successes of Palo Alto and Sunol, and of the many great trotting performers, out of either thorough or half-bred mares, should delight the trotting student with the fact that there will always exist, to the remotest time, one magnificent establishment where the constant infusion of thoroughbred blood into trotting lineage will continue as long as it may demonstrate its value by its immediate and remote results upon the trotting turf. Possibly only an enthusiast, like Governor Stanford, could withstand the tide of opposition which the trotting breeders and the trotting press have rolled up, like a solid wall, against his success. The only encouragement he has met with has been the concurrent testimony of the great trainers that

Digitized by Google

h-bred trotters outlast those less ly bred. But the phenomenal suc- s of his initial experiments have been paraged by turf writers by attributing m to the exceptional prepotency of a itary trotting sire, Electioneer. But sons, Azmoor, and Whips, and Ansel, proving the falsity of this position, l only time seems to be necessary for more perfect vindication.

CONCLUSION.

The earnest desire of the writer has n to make this review of the methods Palo Alto so exhaustive and impar- l that it may be worthy of preserva- n," as an integral portion of trotting- rse history. It is far removed from bserviency to any breeder's personal erests, and infinitely above obsequency any writer's assumption of supremacy, the great teacher. Neither Governor anford, if his shining gold could com- ss all the wealth of the Indies, nor r. John H. Wallace, if his writings mprehended all the subtle researches the science of biology, would ever be ntioned, could the subject be intelli- ntly illustrated without these refer- ces. Both of them are entirely un- nscious of the scope of these papers l they are published; for neither one s been consulted during their prepa- tion. Both are intelligently admired r their works, with the generous spirit which an American scholar always preciates distinguished merit. Due aise, as well as discriminate compari- n of their achievements in the depart- ent of formulating and crystalizing the merican trotting horse, has been tempted with no ulterior object in view an that of reaching those conclusions, this subject, of national magnitude, which the facts and the deductions of ir reasoning infallibly lead. He who akes public opinion, whether in morals science, or the affairs of state, wields power more dominant and despotic an the decrees of the queenly ruler pon whose domains the sun never ceases shine. In the realm of trotting horse terature Mr. John H. Wallace for venty years became the usurper, and, ntil his abdication in 1891, wielded most without opposition this indescribably despotic authority. His dictatorship in many respects was the most beneficial assumption of power that could possibly have come to the trotting-horse community; and yet, it has been very far from being an unmixed good. The greatest evil it has fastened upon the body politic of the trotting-horse breeders is the dictation as to what strains shall and what lineage shall not enter into the blood elements of the composite trotter; and especially that the thoroughbred strain shall be positively excluded. Emancipation from this servitude is just now appearing, like the first rosy tints of the morning in the trotting horizon. "Like produces like" has been the decree from his sanctum. Like produces like has been repeated and echoed and re-echoed by every breeder, great and small, ever since, from the Atlantic to the Pacific. The wonder is that when even a profound student of the trotting horse, like the scholarly Judge M. W. Oliver, should demand, at the recent meeting of the Trotting Registry Association, with an irony that had a world of rebellious skepticism in its intonations, "Like what!" thus calling up before them by two monosyllables the incongruous elements of the English thoroughbred, the desert Arabian, the diminutive Barb, the mongrel pacing, and the native common stock ancestry of that anomalous breed among domesticated horses, the swift American trotter, the assembled trotting horse purists did not meet his defiance in the spirit of their whilom master, with unmeasured condemnation.

This defiant skepticism courageously voiced the opposition of Senator Stanford and Munroe Saulsbury among the breeders, and Orrin Hickok and John Goldsmith among the trainers, of that gradually widening circle among trotting horsemen, who, recognizing the composite elements and the process of evolution of the American trotter, insist that his blood elements should not be limited until they comprehend and exhaust all the stamina and speed that can be acquired by the judicious admixture of that most superlative of all breeds, the thoroughbred race horse. In the realm of trotting-horse ratiocination there has never been a more absolute autocrat than Mr. John

Digitized by Google

H. Wallace. With a zeal for delving into trotting horse lore equal to that of Dominie Sampson for obscure authors, and a mania for bringing to light forgotten pedigrees, equal to the patient persistency of Old Mortality in retracing upon the moldering tombstones the almost obliterated epitaphs of forgotten generations, Mr. Wallace has brought to trotting-horse literature a wealth of unknown pedigrees and a series of historical tabulations that are simply invaluable. Without a patron to substantially recognize his worth, or a public to give him immediate support, without private resources to sustain him in obscurity, he struggled on, through dire poverty for years till he astonished the trotting-horse student by the production in 1871 of his first volume of "Wallace's American Trotting Register," a volume containing the pedigrees of all the older trotters, with their performances, and supplemented with a masterly essay in support of his later position that the American trotting families all derived their trotting superiority from imported Messenger. Not only do the Morgans and Bashaws thus receive their trotting leaven, he contends, but that all other thoroughbreds that have commingled kindly with the trotter are thus dependent upon Messenger.

To place, in juxtaposition, the first and last sentences of this valuable preface, speaking of Duroc, Trustee, Glencoe and other thoroughbreds, he says in conclusion: "None of them either possessed or "imparted inherent trotting qualities but "all alike were dependent upon the great "English Mambrino," and yet he begins the essay with the statement, "The "American trotting horse is the develop-"ment of the last fifty or sixty years." The three corner-stones of the foundation of the splendid superstructure he has raised to his mind, that will endure long after his body has crumbled into nothingness, are 1. English Mambrino, alone among thoroughbreds transmitted trotting inheritance; 2. Like produces like, therefore, inbreed to the Messenger blood wherever found; 3. The American trotting horse is the development of the present century.

In 1874 the second volume appeared containing many more pedigrees, some of them, for the first time in trotting history, in tabulated form, showing the collateral blood lines, also all the trotting records since 1871, and the elaborate development of the "trotting instinct" theory in connection with the repeated initial axiom, "Like begets like."

These opening volumes of "Wallace's American Trotting Register" were published at the most opportune time possible. Prior to 1870 the trotting turf had become so degraded and trotting races the scenes of so much fraud and violence, that, had there been no relief, the trotting horse would have become extinct through turf abuses, and his registration a work of supererogation.

In 1870 came the reformation to which must be traced not only the salvation of the trotting horse himself, but the rapid process of his evolution since, and the perpetuation of his accurate registration.

This was the organization of the National Trotting Association in 1870. Stringent rules for the conduct of trotting races, including the judges in the stand, as well as the trainers, owners and horses, were codified. Suspension or expulsion, at one course, operating with equal force upon every other course, induced all trotting associations to become members, and exact justice was extended, in all cases, by right of appeal to the supreme trotting congress. Never was the first draft of a series of rules more impartial or effective in application. The result was a magical reform. The trotting horse at once became respectable property, and his owner no longer the object of social and business ostracism. His breeding became the subject of more intelligent research, and his production and development the objects of more scientific consideration. Mr. Wallace seized upon this powerful auxiliary to his success. In the first volume he published this code of trotting laws and continued to publish them, with approval, in every subsequent volume. From the records of this National Association he drew his official statistics of races, which lent an additional value to his trotting registers as works of reference.

Digitized by Google

In the following year, 1875, Mr. Wal-

ace began the publication of WALLACE'S MONTHLY, devoted almost exclusively to the interests of the American trotting horse, to the success of which Mr. Peter L. Kellogg, as Hark Comstock, and many others, including the writer, contributed to the opening and succeeding numbers, for years, carefully prepared papers.

Under the advice of Hark Comstock in 1876 the formation of a National Trotting Horse Breeders' Association was agitated, and in the following year the organization was completed.

The basis of the breeders' organization was pedigree. The trotting records up to that date, first published in book form in "Wallace's American Trotting Horse Register," Vol. II., 1874, was supplemented by six tables classifying the same, which ultimately gave rise to the Standard. Table I tabulated all trotting heats to harness in 2:30 or better, from the earliest records to 1873. Table II set forth two-mile heats in five minutes or less. Table III showed the thirty-two horses with records from 2:16¾ to 2:30, specifying both their number of heats in 2:30 and their breeding. Table IV contained the first roll of honor, displaying the names of the sires of 2:30 horses, showing the number of performers and heats credited to each in harness. Table V exhibited the comparative prevalence of certain strains of blood in the known 2:30 horses. Table VI presented the growth of trotting interests, showing that recorded contests had increased from 1,095 in 1879, to 2,512 in 1873, and the number of heats from eleven in 1856 to 475 in 1873.

The third volume of "Wallace's Trotting Register" was not issued till 1879, but the Breeders' Association, that had then been in existence for two years, had made its power felt in this volume, as evidenced by the fact that the context presents *broodmares with their produce;* while the supplemental table records all 2:30 performers in harness *under their sires.* These classifications all pointed to a more definite knowledge and appreciation of successful trotting lineage, which must eventuate in a standard and type of the approved trotting horse in the immediate future. In the same year came the promulgation of the standard of admission to registration by the National Association of Trotting Horse Breeders, comprising ten rules, based mainly upon a 2:30 performance qualification, as a means of defining what constitutes a trotting-bred horse, and of establishing a breed of trotters on a more intelligent basis. Mr. Wallace was made the registrar, and his performance of the arduous duties has met with the mingled praise and censure of both friends and enemies year after year till his connection with the enterprise ceased in 1891.

Meantime, in 1886, he began the publication of a series of year books—containing complete summaries of heats trotted or paced in 2:40 or less—from the official records; also a complete 2:30 list of trotters and pacers; the Great Table of sires with their performing produce in 2:30 or less; the "Table of the Sires of Dams of Performers;" the "Table of Great Brood Mares," and the table of fastest records. Each succeeding season these Year Books have been published, now numbering seven volumes, and the Trotting Registers have been issued, as material was furnished, now comprising eleven large volumes, all of which were published by Mr. Wallace, with the exception of the last three volumes, being the last ones of each, these last three being issued under the control of the American Trotting Register Association, which in 1891 superseded both the National Breeders Association and Mr. Wallace in the ownership and management of these valuable trotting-horse publications. These volumes embrace all past trotting history, records, blood elements and materials. They thus furnish the most exhaustive reference library, on this specialty that can possibly ever be compiled.

In this herculean work Mr. Wallace stands out as the foremost toiler. Many of the progressive steps, the suggestions of some of the tables, the classification of sires and dams, and other valuable ideas that gradually led the minds of trotting-horse breeders up to the establishment of the Standard came from the contemporary turf press, notably the

Digitized by Google

Spirit of the Times, the New York *Sportsman* and the *Turf, Field and Farm*, and their corps of intelligent correspondents. But Mr. Wallace was undoubtedly among them like Achilles among the bands of Grecian heroes—he overtopped them all. This towering position gave him almost unlimited authority, and he used it, like Thalus with his iron flail, with unmeasured severity. He alienated the support of some of the leading breeding farms, like Woodburn and Ashland and many others. He pursued his hobbies with relentless savagery and lampooned breeders and writers alike, who dared to oppose his theories. Unable to control, as an unit, the older breeders, his main endeavor was to educate and control "the young breeders," and the columns of the MONTHLY were laden with advice for their guidance, both wise and questionable. They had come to believe in his sayings and conclusions as absolutely infallible. Even many of the older breeders have gradually fallen into line. He has proclaimed there can never be a distinctive trotting form, only trotting instinct, and some of the elder breeders chant, in approving echo, "Only trotting instinct!" In the anathema against the infusion of any other thoroughbred blood than that which comes through Messenger, he contemptuously proclaimed in stentorian tones, "Running foolishness!" From every glen and hill top and sweep of prairie that contains a trotting-stock farm came the distinct reverberation, "Foolishness!" Strange to add, after it had climbed the Sierras and nestled down in the valley of Santa Clara, the echo had changed its tones from "running foolishness" to "running wisdom." For, in defiance to this august authority, Governor Stanford has founded and carried on successfully, with thoroughbred broodmares as an integral factor, the leading trotting brood farm of the world. This required courage, intelligence, judgment and capacity.

It will be a surprise to the general reader, as well as possibly a source of mortification to the mere tinkle-tinkle-tintinnabulation, lamb-like followers of their great shepherd, to learn that Governor Stanford, in his trotting-horse researches, could have found not only sufficient authority, in the writings of Mr. Wallace, for the use of thoroughbred mares, but for what he has never yet even dreamed of employing, namely, thoroughbred sires to beget trotting performers of ultimate speed and stamina.

For Mr. Wallace was not always exclusively devoted to the compilation of trotting registries. In 1867 he presented to the turf community the first volume of his "American Stud Book." That first volume, like many another one of a proposed serial publication, such as the "Kentucky Stud Book" and "Parson's Pacing Register," dropped so palpably still-born that a companion volume never became an after-birth.

On page 21 of this volume Mr. Wallace thus expresses his deliberate conclusions, fortified, as they always are, with due solemnity, by "the experience of ages, "and the laws of breeding. It is to be "regretted, that, in our day, *we have so* "*few trotting races, over a mile*, as it is "staying the distance that most clearly "demonstrates the value of blood.

"This question of the value of blood "in the trotting horse has been dis-"cussed over and over again for the last "thirty years, *with a disposition to* "*beat rather than to arrive at the truth.* "There are one or two thoughts, *or, I* "*should rather say facts*, that lie at the "foundation of this question, and to "which the disputants, on both sides, "must give their assent. The experience "of generations has proved that the "thoroughbred horse will endure more "than any other, and, as trotting is a "test of endurance, in that particular, the "blood horse has the advantage. Then "too, horses of equal speed will depend, "necessarily, on endurance to win, and "if blood has the endurance the question "of superiority is settled. If the thor-"oughbred horse, with the proper trot-"ting action, is not preferable to breed "from, then *the experience of ages* in "breeding racers, *and the law which* "*governs* in breeding all other domestic "animals, is at fault in breeding trot-"ters."

If Palo Alto needed any higher authority for the use of thoroughbred blood in the production of the improved trotting performer, it would have been forced to await the coming of that more

Digitized by Google

august, impossible, personality, the compiler, *de novo*, of an entirely new Standard American Trotting Register. The turf press has regarded this impartial examination of the methods of Palo Alto as an onslaught upon the certain methods of crystalizing the trotting pedigree, namely, to breed trotting-bred sires to trotting-bred matrons, but such is an unfair construction of the scope of these papers. The magnificent establishment of Gov. Stanford is unique in trotting-horse history. Unlike the vast majority of its reviewers it is liberal in principle and practice to the extreme limit of trotting-horse possibilities. It is the advance experimental station in working out the complicated trotting-horse breeding problem; and, as such, none of its methods should receive adverse criticism until each specific line of breeding has received its full fruition. Even if thoroughbred mares for trotting matrons had proven failures before the thoroughbred mare Sally Russel to the embrace of Pilot Jr. produced the dam of Maud S. and the pure-bred Twilight, in the harem of the same horse, foaled the dam of Jay Eye See, the conditions have so materially changed in the more judicious selection of running-bred mares, with more pronounced trotting action, and the vastly more prepotent trotting sires that the chances of success have materially increased within the past decade. This prepotency is rapidly becoming so powerful that the demonstrations of Palo Alto have shown that this trotting potency can overcome the galloping tendencies of the running cross, with the greater speed inheritance of the blood horse utilized for trotting performances.

Despite the adverse criticism, there is not a single trotting purist, be he editor, breeder, or trainer, that would summarily estop the experiment of Palo Alto in using thoroughbred matrons in this early stage of its brilliant progress. None of them would say to Senator Stanford cease this production of Palo Altos and Ansels, and Whips, and Azmoors, and Anteos and Antevolos, for they are sending to the trotting turf thus early in their careers too many winners, like Azote and Antella, and Avena, and Anteo Richmond, to warrant such a decree. In no more forcible way can the illiberal criticism be crucified.

If the enquiry should be presented to the writer, "Do you advise the breeders, "at large, to resort to thoroughbred "mares for trotting matrons to the ex-"clusion of trotting-bred mares?" the answer in the negative would be as positive and conclusive as words could be framed. Palo Alto itself neither advocates nor practices such an extreme absurdity; for its trotting-bred broodmares far outnumber its running-bred matrons.

If the modified question was presented: "Should the average trotting breeder employ thoroughbred mares in the hope of securing, like Senator Stanford, the extremest trotting speed?" the answer would still be in the negative. Breeding the trotting horse, notwithstanding the apparent plethora of standard stock and standard performers, is, at best, as expensive as it is precarious. The trotting pedigree has become so intense that the average breeder should confine himself to the most uniform and the best established lines for producing trotters. Like the farmer who depends upon routine crops that have a certain, reliable yield, he should not employ experimental seed involving the possibility of even a diminished harvest.

Daring methods, like the use of the thoroughbred mare, require patience, caution, discrimination, and affluence. The results are far reaching, leading either to an improved breed of trotters, and the attendant munificent returns, or to years of failure and consequent bankruptcy. They should not be made by the average breeder. When they have become so successful and uniform that the experimental phase has been eliminated; so that the ratio of success, taking in consideration the certainty of greater speed and stamina, which are the only elements sought to be obtained from the thoroughbred infusion, compares favorably with the purist method of breeding trotters, then and not till then should the breeders at large employ thoroughbred mares. But this decision does not preclude leading establishments, like Palo Alto and the Village Farm, and those of Mr. Bonner and of

Digitized by Google

Miller & Sibley from using these thoroughbred matrons in the hope of perfecting the speed and courage of the future trotting horse.

In any other country these leading farms would be government establishments, clothed with all the authority and prestige that royalty could confer upon them. In democratic America they not only receive the discouragement of turf editorial derision, but the baleful prophecies of dire failures are heaped upon them in the very face of their preliminary successes. This procedure may be the epitome of the philosophy and the science of trotting-horse breeding of to-day, but all the portents of the future bid fair to prove that it will be the folly of to-morrow.

Yet such is the pliability of human wisdom that when the despised theory of the present becomes the accepted fact of the future, there is no one to admit among those high in authority that they voiced the opposition by the least articulation of dissent.

If Palo Alto, and Whips, and Azmoor, and Ansel succeed with thoroughbred mares for trotting matrons there will be no confessors of mistaken opposition among the trotting purists, not even attempts to invalidate the pedigrees of the thoroughbred matrons, or to assert that this overwhelming trotting potency is confined to a solitary trotting sire; but all, with loud acclaim, will praise the exceedingly logical and physiological, and psychical methods of Palo Alto. Rowena, who carries eighty per centum of thoroughbred blood already has the two-year-old racing record. Before this paper is in press she may have the two-year-old record in all forms. Her last quarter, only a quarter of a second slower than the fastest quarter, was trotted in thirty-four seconds, and the last hundred yards of the finish was certainly at a much faster momentum. The superintendent of Palo Alto on September 26, 1892, thus writes of her immediate future: "I do not think she "is near her mark. In November, over "the kite-shaped course at Stockton she "will be knocking at the gate of Arion! "Had Palo Alto lived I believe he would "have been the greatest of sires. We "have two of his two-year-olds in training, the one Erastus C., who lately "trotted a quarter in thirty-seven seconds, and can trot at that rate the "mile; and Avena whose record of 2:30, "in the second heat, showed the last "half mile in 1:10½, the last quarter in "thirty-three seconds, and the last eighth "in fifteen and a half seconds! (This "last eighth is at the rate of a mile in "2:04, the superlative time of Nancy "Hanks!) When we reach Stockton "with her, watch for the mark she will "make!"

Beyond the great waters Senator Stanford writes: "It is with regret that I "read of Palo Alto's death, not for the "pecuniary loss to myself, but for the "loss to the breeders and the trotting-"horse interests."

This is the broad-minded lament of a true horseman, devoid of belittling prejudices and iron-clad methods. He adds: "The last census of live stock shows there "are 15,000,000 horses in the United "States. In my judgment they can be "increased in value an average of $50 "a piece. In California I am trying to "accomplish this result." If the oncoming of age was not settling down upon his head like the frosts of early autumn upon the blooming flowers, he would be mighty enough in courage and enterprise to undertake this herculean task for the entire country. If there could be a concensus of opinion from minds as unprejudiced and comprehensive as his own, the decision would be that he would sooner accomplish this splendid result with high-bred, developed trotting sires like Palo Alto, Azmoor and Whips, than with horses whose pedigrees are less strongly fortified with the lineage of the race-horse of the civilized world. Meantime his methods are becoming so well established in the use of thoroughbred blood for the elevation of the trotter that their tabulation will overwhelm all speculative reasoning.

He proved in the instance of Sunol what Kentucky had formerly demonstrated in the cases of Maud S. and Jay Eye See, and what that commonwealth has again exemplified in the production of Moquette, that the thoroughbred grandam will insure extreme speed in the foal,

Digitized by Google

if the sire is a strongly prepotent trotting-bred horse, whether his trotting capacity has been developed or not. Nor can the thoroughbred grandam be eliminated in the calculation, on the ground that the trotting top cross in the dam is the active factor, for neither Pilot Jr. nor General Benton sired any other daughters than those out of thoroughbred mares that have produced Jay Eye Sees or Maud S.'s or Sunols!

He advanced another step, and proved that extreme trotting speed comes from the union of a great trotting sire with thoroughbred mares of approved form, lineage and trotting action. He not only presented to the turf the champion trotting stallion, Palo Alto, 2:08¾, thus bred, but reinforced him with Azmoor and Whips, Ansel, and such a notable collection as to preclude all possibility of being classed as exceptional freaks of breeding. This season his demonstrations extend still further. These half-bred sires are producing phenomenal speed in their baby produce as well as their aged representatives, for Azote is as remarkable in his class as Rowena and Anselma in their juvenile stake races.

Moreover one of these half-bred sires has gone beyond all expectation in producing, up to that date, out of a thoroughbred mare, the champion trotting two-year-old race performer in trotting annals. The argument is very conclusive that the thoroughbred blood, when thus properly selected, commingles kindly with trotting strains in the production of great results, instead of being antagonistic, as has been the general contention. The combination of thoroughbred elements throughout the history of the trotting horse had already indicated this result in a modified degree, notably in the evolution of such producers as Alcyone, the sire of Martha Wilkes, and the dams of Sunol and Maud S., but this stronger infusion furnishes a more interesting study of the extent to which thoroughbred blood may be used without disturbing the trotting action or interfering with the balanced trotting brain.

If trotting purists, like the worthy editor of this journal, take the other horn of the dilemma, and claim that the trotting sire has now become so phenomenal that he can "wipe out the blood of the "running mare which produced Azmoor, "and the trotting blood of Azmoor, in "turn, overcame and nullified the run-"ning blood of the dam of Rowena," then, conclusively, the trotting inheritance has become so intense that one-fifth trotting blood can control at least four-fifths of the older, more concentrated, running blood in the issue. With such an intensity of reproduction, the result follows that there can be no possible danger of weakening the trotting inheritance by commingling with either thoroughbred or half-bred mares, and the crossing, therefore, can safely continue, until the most satisfactory productions that can possibly issue from the thoroughbred commingling have been evolved.

Meantime the performances of Nancy Hanks have thrown again upon the Palo Alto ranch the burden of proof that a strong infusion of thoroughbred blood is the most effective means of producing the extremest trotting speed. The champion record of Maud S., followed by that of Sunol among mares, and still more, that of Palo Alto among stallions, had shifted this burden of proof upon trotting purists. Now their positions are radically changed, for the 2:10¾ of Arion, the 2:08¾ of Belle Vara, and the 2:04 of Nancy Hanks afford the only conclusive statistics in controverting the position of Senator Stanford that the trotting lineage needs still further infusions of thoroughbred blood to increase the speed, or to strengthen the endurance of the perfected trotter.

Nothing has developed the persistence of this remarkable trotting-horse breeder like united opposition to his methods, and he will pursue these methods to their experimental exhaustion, relying upon practical results for their confirmation.

While the issue is thus fully made up, and the experiments are thus being made upon the most intelligent basis, with the richest possible resources, the impartial student will patiently await the most mature results before pronouncing an *ex cathedra* decision.

However greatly turf journals and able writers may disagree with the methods of Palo Alto they will all unite in

Digitized by Google

generous praises to the princely munificence and the profound ability as a trotting-horse breeder of its noble founder.

Nota Bene. The writer would evince an insensibility amounting to ingratitude should he close this series without acknowledging his indebtedness to Mr. Frank W. Covey, the able and courteous superintendent of the trotting-horse department of Palo Alto, for invaluable information that has added much to both the web and the woof of these papers.

PROBLEMS IN BREEDING.

BY A. H.

Heredity.

II.—THEORY.

* * "Even the homely farm
Can teach us there is something in descent."

So much is the law of inheritance recognized that its expression—*Like begets, or tends to beget like,* is an everyday truism. It is believed by all, and thus has received classic attention as in the quotation we give above from England's now late poet laureate.

Heredity is indeed a fact. But an explanation or theory of its rationale, has been lacking. Waif-like ideas have been floating about on the scientific ocean. Darwin attempted a strictly provisional hypothesis to which he gave the name of "Pangenesis." This he did not expect to be permanent, but suggested as a recognition of the important place a philosophical theory could fill in connection with that of evolution. Other English scientists, particularly Galton, have brought forward suggestive views. Perhaps the latter was the first to give the real key to the proper manner of studying the question.

In the meantime, with the great advances being made in microscopical methods, such immense discoveries had been announced as have been related in our last article. With these as a basis, and with the advantage of instinctive ideas already expressed, Weismann, the distinguished Freiburg professor, gradually, in a remarkable series of essays prepared the world for a scientific theory in harmony with the facts. It is not here implied that Weismann's theory is accepted as a correct interpretation of these facts. But undoubtedly he has done more than any one to put the matter on a scientific basis, *i.e.*, to place it so that investigation of fact is directed into proper channels that sound theory may be therefrom deduced.

As Weismann's whole "excogitations of hypotheses" have been effective of so much renewed interest, criticism and investigation, are in fact so paramountly important, it is necessary, in any present discussion of the question to examine them carefully. We therefore shall devote this article to a presentation of this theory in relation to heredity itself, and also—in its broader aspects—to evolution, as contained in his first series of essays.

Weismann indeed may fairly be said to have expounded an entirely new method and scheme of study in regard to heredity. His essays are full of most interesting, suggestive and valuable matter. His presentation is therefore extremely readable, and on that account we have been induced to make a rather free abstract of his main theory of the "Continuity of the germ-plasm." Following this we give a more concise abstract of the general bearings of his theory on the wider questions involved in evolution itself. In the first we present Weismann's own words; in the second, to show how the theory appears to biologists at large, we have utilized part of Professor G. J. Romanes' review* as the best general sketch of the several theories yet published.

We therefore plunge at once, without further diffusive preliminary, into the subject.

WEISMANN'S THEORY.

I.—*The Transference or Continuity from Generation to Generation of the Hereditary Substance.*—"How is it," asks Weismann, "that the individual is able to transmit its structural features to its offspring with such precision?"

*Contemporary Review, Vol. LVII, May, 1890.

Digitized by Google

The immediate answer to such a question must be given, he says, in the following terms: "A single cell, out of the millions of differentiated cells which compose the body, becomes specialized as a sex-cell. It is thrown off from the organism and is capable of reproducing all the peculiarities of the parent body in the new individual which springs from it by cell division." Then the more precise question follows: "How is it that such a single cell can reproduce the *tout ensémble* of the parent with all the faithfulness of a portrait?"

The answer is extremely difficult and has engaged the minds of our greatest naturalists. There have been several theories advanced, all of which are inadequate, according to Weismann. As he discards Darwin's ingenious but provisional theory of Pangenesis there remains, as it seems to him, only two other possible physiologically conceivable theories as to the origin of the germ-cells manifesting such powers as we know them to possess. Either the substance of the parent germ-cell is capable of undergoing a series of changes which, after the building up of a new individual, leads back again to identical germ-cells; or the germ-cells are not derived at all, as far as their essential and characteristic substance is concerned, from the body of the individual, but they are derived directly from the parent germ-cell.

Weismann believes that the latter view is the correct one. He calls it the theory of "The Continuity of the Germ-plasm," for it is founded upon the idea that heredity is brought about by the transference from one generation to another, of a substance with a definite chemical, and above all, molecular, constitution. This substance Weismann has called the *germ-plasm* and assumes that it possesses a highly complex structure, conferring upon it the power of developing into a complex organism.

He has attempted to explain heredity by supposing that in each ontogeny (the genesis or development of the individual), a part of the specific germ-plasm contained in the parent egg-cell is not used up in the construction of the body of the offspring, but is reserved unchanged for the formation of the germ-cells of the following generation.

Heredity thus Simply becomes a Question of Growth and of Assimilation.—If the germ-cells of successive generations are directly continuous and thus only form, as it were, different parts of the same substance, it follows that these cells must, or at any rate may, possess the same stages under certain conditions of development, and would form the same final product. The hypothesis of the continuity of the germ-plasm gives an identical starting point to each successive generation and thus explains how it is that an identical product arises from all of them. In other words the hypothesis explains heredity as part of the underlying problems of assimilation and of the causes which act directly during ontogeny. It therefore lays a foundation from which the explanation of these phenomena can be attempted.

Difficulties of the Theory—Denial of Transmissibility of Acquired Characters, so called.—It is true this theory also meets with difficulties, for it seems to be unable, as Weismann demonstrates, to do justice to a certain class of phenomena, *viz.:* the transmission of acquired characters. Weismann denies, *in toto*, that acquired characters, as properly understood, have ever been proved to have been transmitted. He declares that facts that have been interpreted under such hypothesis can be interpreted or expressed differently.

The Prominence Given to "Predisposition" in the Theory.—An organism can not acquire anything unless it already possesses the predisposition to acquire it. Acquired characters are therefore no more than local or sometimes general variations which arise under the stimulus provided by certain external influences.

Nothing can arise in an organism unless the predisposition to it is preëxistent, for every acquired character is simply the reaction of the organism upon a certain stimulus.

Important Admissions and Denials.—Weismann does not assert that predispositions can not be transmitted. He is also far from asserting that the germ-plasm, which, as he holds, is transmitted

Digitized by Google

as the basis of heredity from one generation to another, is absolutely unchangeable or totally uninfluenced by forces residing in the organism within which it is transformed into germ-cells. He is also compelled to admit that it is conceivable that organisms may exert a modifying influence upon their germ-cells, and even that such a process is, to a certain extent, inevitable. The nutrition and growth of the individual must exercise some influence upon its germ-cells; but, in the first place, this influence must be extremely slight, and, in the second place, it can not act in the manner in which it is usually assumed that it takes place. A change of growth at the periphery (circumference) of an organism can never cause such a change in the molecular structure of the germ-plasm as would augment any predisposition. Any change produced would result from the reaction of the germ-cell upon changes of nutrition caused by alteration in growth at the periphery, leading to some changes in size, number or arrangement of its molecular units. In the present state of our knowledge there is reason for doubting whether such reaction can occur at all. But if it can take place, at any rate the quality of the change in the germ-plasm can have nothing to do with the quality of the acquired character, but only with the way in which the general nutrition is influenced by the latter. Up to the present time it has never been proved that any changes in general can modify the molecular structure of the germ-plasm, and far less has it been rendered by any means probable that the germ-cells can be affected by acquired changes which have no influence on general nutrition.

Tendency to Transmit Present, Previous to Appearance of Acquired Character.—If we consider that each so-called predisposition—that is, a power of reacting upon a certain stimulus in a certain way, possessed by any organism or by one of its parts—must be innate, and, further, that each acquired character is only the predisposed reaction of some part of an organism upon some external influence, then we must admit that only one of the causes which produce any acquired character can be transmitted, the one which was present before the character itself appeared, *viz.*, the predisposition; and we must further admit that the latter arises from the germ, and that it is quite immaterial to the following generation whether such predispositions come into operation or not.

The continuity of the germ-plasm is amply sufficient to account, according to Weismann, for such a phenomena, and he does not believe that any objection to his hypothesis, founded upon the actually observed phenomena of heredity, will be found to hold. If it be accepted many facts will appear in a light different from that which has been cast upon them by the hypothesis which has hitherto been received—a hypothesis which assumes that the organism produces germ-cells afresh, again and again, and that it produces them entirely from its own substance. Under the former (Weismann's) theory the germ-cells are no longer looked upon as the product of the parents' body—at least as far as their essential part, the specific germ-plasm, is concerned; they are rather considered as *something which is to be placed in contrast* with the *tout ensemble* of the cells which make up the parents' body, and the germ-cells of succeeding generations stand in a similar relation to one another as a series of generations of uni-cellular organisms, arising by a continued process of cell-division.

Germ-plasm, not Germ-cells, the Immortal Part.—It is true that in most cases the generations of germ cells do not arise immediately from one another as complete cells, but only as minute particles of germ-plasms. This latter substance, however, forms the foundation of the germ-cells of the next generation, and stamps them with their specific character.

The ideas expressed by some as to the continuity of the germ-*cells* can not be maintained except in very rare cases. But this fact does not prevent us from adopting a theory of the continuity of the germ-*plasm*.

This theory does not presuppose anything except facts which can be observed at any moment, although they may not be understood—such as assimilation, or the development of like organisms from like germs; while every other theory of

Digitized by Google

heredity is founded on hypotheses which can not be proved.

The Theory Marks the Advancement of Our Knowledge.—It is, Weismann admits, nevertheless possible that continuity of the germ-plasm does not exist in the manner in which he himself imagines that it takes place, for no one can at present decide whether all the ascertained facts agree with and can be explained by it. The ceaseless activity of research brings to light many new facts every day, and he is far from maintaining that his theory may not be disproved by some of them. But if even it should have to be abandoned at a later period, it seems to him that at the present time it is a necessary stage in the advancement of our knowledge, and on which must be brought forward, and passed through, whether it prove right or wrong, in the future. In this spirit Weismann offers it, and in this spirit he wishes his theory to be received.

The Germ-plasm Defined and Demonstrated.—The germ-plasm is that part of a germ-cell of which the chemical and physical properties—including the molecular structure—enable the cell to become, under appropriate conditions, a new individual of the same species.

The ascertained facts in the case of *Ascaris* plainly show that the nuclear substance must not only be the sole bearer of hereditary tendencies: not only contain the tendencies of growth of the parents, but also those of a very large number of ancestors. Each of the two nuclei which unite in the fertilization must contain the germ-nucleoplasm of both parents, and this latter nucleoplasm once contained, and still contains, the germ-nucleoplasm of the grandparents, as well as that of all previous generations.

Illustrated by aid of Breeders' Phraseology.—It is obvious that the nucleoplasm of each antecedent generation must be represented in any germ-nucleus in an amount which becomes less as the number of intervening generations become greater, and the proportion can be calculated after the manner in which breeders, when crossing races, determine the proportion of pure blood which is contained in any of the descendants. Thus while the germ-plasm of the father and mother constitutes half the nucleus of any fertilized ovum, that of a grandparent only forms a quarter, and that of the tenth generation backward only $\frac{1}{1024}$, and so on. The latter can nevertheless exercise influence over the development of the offspring, for the phenomena of atavism show that the germ-plasm of very remote ancestors can occasionally make itself felt in the sudden appearance of long-lost characters. Although we are unable to give a detailed account of the way in which atavism happens, and of the circumstances under which it takes place, we are at least able to understand how it becomes possible; for even a minute trace of germ-plasm possesses the definite tendency to build up a certain organism, and will develop this tendency as soon as its nutrition is, for some reason, favored above that of the other kinds of germ-plasm present in the nucleus. Under these circumstances it will increase more rapidly than the other kinds, and it is readily conceivable that a preponderance in the quantity of nucleoplasm may determine its influence upon the cell body.

The nature of heredity is based upon the transmission of nuclear substance with a specific molecular constitution. This substance is the specific nucleoplasm of the germ-cell—Weismann's germ-plasm or Nägeli's idioplasm (of the germ-cells).

Weismann has endeavored to prove that the germ-cells of an organism derive their essential nature from the fact that the germ-plasm of each generation is *carried over* into that which succeeds it. He has attempted to show that during development of an egg into an animal, a part of the germ-substance—although only a minute part—passes over unchanged into the organism which is undergoing development, and that this part represents the basis from which future germ-cells arise. In this way it is to a certain extent possible to conceive how it is that the complex molecular structure of the germ-plasm can be retained unchanged even in its most minute details, through a long series of generations.

Digitized by Google

Cytoplasm and Nucleoplasm of Germ-cells, Functions.—Weismann entirely agrees with Strasburger when he says: "The specific qualities of organism are based upon nuclei. Molecular stimuli proceed from the nucleus into the surrounding cytoplasm; stimuli which, on the one hand, control the phenomena of assimilation in the cell, and on the other hand, give to the growth of the cytoplasm, which depends upon nutrition, a certain character peculiar to the species." The nutritive cytoplasm assimilates, while the nucleus controls the assimilation, and hence the substances assimilated possess a certain constitution and nourishes in a certain manner the cyto-idioplasm and nuclear idioplasm.

In this way the cytoplasm takes part in the phenomena of construction, upon which the specific form of the organism depends. This constructive activity of the cyto-idioplasm depends upon the regulative influence of the nuclei. The nuclei, therefore, "determine the specific direction in which an organism develops."

The opinion—derived from the recent study of the phenomena of fertilization—that the nucleus impresses its specific character upon the cell, has received conclusive confirmation. It is therefore, only under the influence of the nucleus that the cell substance redevelops into the full type of the species. In adopting the view that the nucleus is the factor which determines the specific nature of the cell, we stand upon a firm foundation upon which we can build with security.

The Question as to the Manner in which the Plasm Subsequently Changes During Early Differentiation.—If, therefore, the first segmentation nucleus, in its molecular structure contains the whole of the inherited tendencies of development, it must follow that during segmentation and subsequent cell division, the nucleoplasm will enter upon definite and varied changes which must cause the differences appearing in the cells which are produced; for identical cell-bodies depend, *ceteris paribus*, upon identical nucleoplasm, and conversely different cells depend upon differences in the nucleoplasm. The fact that the embryo grows more strongly in one direction than in another, that its cell layers are of different nature and are ultimately differentiated into various organs and tissues—forces us to accept the conclusion that the nuclear substance has also been changed in nature, and that such changes take place during ontogenetic development in a regular and definite manner.

We are thus led to the important question as to the forces by which the determining substance or nucleoplasm is changed, and as to the manner in which it changes during the course of ontogeny.

On the answer to this question his further conclusions must depend. The simplest hypothesis would be to suppose that at each division of the nucleus, its specific substance divides into two halves of unequal quantity so that the cell-bodies would also be transformed—for we have seen that the character of a cell is determined by that of the nucleus. Thus in any Metazoon (multicellular organism) the first two segementation spheres would be transformed in such a way that one only contained the hereditary tendencies of the endoderm, and the other those of the ectoderm, and therefore, at a later stage the cells of the endoderm would arise from the one and those of the ectoderm from the other; and this is actually known to occur.

In the course of further division the nucleoplasm of the first ectoderm cell would again divide unequally, *e. g.*, into the nucleoplasm containing the hereditary tendencies of the nervous system, and into that containing the tendencies of the external skin. But even then, the end of the unequal division of the nuclei would not have been nearly reached; for, in the formation of the nervous system, the nuclear system which contains the hereditary tendencies of the sense-organs, would in the course of further cell-division, be separated from that which contains the tendencies of the central organs, and the same process would continue in the formation of all single organs, and in the final development of the most minute histological elements. This process would take place in a definitely ordered course, exactly as it has taken place throughout a very long series of ancestors; and the determining and directive factor is simply and solely the

Digitized by Google

nuclear substance, the nucleoplasm, which possesses such a molecular structure in the germ-cell that all such succeeding stages of its molecular structure in future nuclei must necessarily arise from it, as soon as the requisite external conditions are present.

The Fact with which All Explanation Must be Made to Agree.—It appears at first sight that the knowledge which has been gained by studying the division of nuclei by the process of kariokinesis is opposed to such a view—for we know that each mother-loop of the so-called nuclear plate divides longitudinally into two exactly equal halves, which can be stained and thus rendered visible. In this way each resulting daughter nucleus receives an equal supply of halves and it therefore appears that the two nuclei must be identical. Such an identity is regarded as a fundamental fact which can not be shaken, and with which all attempts at further explanation must be brought into accord.

The nucleus always divides into parts of equal quantity; and further, in every nuclear division, each daughter-nucleus receives the same amount of nuclear substance from the father as from the mother. But, as seems to Weismann, it is very far from proving that the quality of the parent nucleoplasms must always be equal in the daughter-nuclei. It is true, the fact seems to prove this. But we must not forget that we do not see the minute molecular structure of the loop material. We have, in the former article given Weismann's words on this point so need not repeat them here. It is quite reasonable to admit that there is an illimitable variety of possible combinations of the dividing loops.

Weismann also advances in support of this, his theory of the different character of the two polar bodies, which will be afterward adverted to.

Though the Quantity of the Divided Loops May be Equal the Molecular Quality May be Unequal.—There does not seem to be any objection to the view that the microsomata of the nuclear loops—assuming that these bodies represent the germ-plasm—are capable of dividing into two halves, equal in form and appearance but unequal in quality. We know that in some egg-cells the first two segmentation spheres are equal in size and appearance, and yet the one forms the endoderm and the other the ectoderm.

Weismann, therefore, believes that we must accept the hypothesis that in indirect nuclear division (kariokinesis) the formation of unequal halves may take place quite as readily as the formation of equal halves, and that the quality or inequality of the subsequently produced daughter-cells must depend upon the nuclei. Thus during ontogeny a gradual transformation of the nuclear substance takes place, necessarily imposed upon it, according to certain laws, by its own nature, and such transformation is accompanied by a gradual change in the character of the cell bodies.

The Molecular Complexity of the Germ-plasm Must be Diminished by Every Subsequent Division.—We must, therefore, conclude that the molecular structure of the germ-plasm in all higher animals must be excessively complex, and, at the same time, that this complexity must gradually diminish during ontogeny as the structures still to be formed from any cell, and, therefore, represented in the molecular constitution of its nucleoplasm, contain preformed structures which are gradually reduced in number as they are given off in various directions during the building up of the organs: the complexity of the molecular structure decreases as the potentiality for further development also decreases—such potentiality being represented in the molecular structure of the nucleus. The nucleoplasm which in the grouping of its particles contains potentially a hundred different modifications of this substance, must possess far more numerous kinds and far more complex arrangements of such particles than the nucleoplasm which only contains a single modification, capable of determining the character of a single kind of cell.

A New Structure, Previously Non-existent, May be Received by Nuclear Division.—We must guard against the supposition that unequal nuclear division simply means a separation of part of the molecular structure. On the contrary the molecular constitution of the mother nucleus is certainly changed during di-

Google

vision in such a way that one or both halves *may* receive a new structure which did not exist before their formation.

The different varieties of nucleoplasm which arise during ontogeny, by means of their molecular structure represent, create a specific constitution in the cell bodies over which they have control, and also because they determine the succession of future nuclei and cells. We may suppose that the idioplasm of the first segmentation nucleus is but slightly different from that of the second ontogenetic stage, viz., that of the two following segmentation nuclei. Perhaps only a few groups of micellæ have been displaced or somewhat differently arranged. But, nevertheless, such groups of micellæ were not the germs of a second stage which pre-existed in the first stage, for the two are distinguished by the possession of a different molecular structure. This structure, the second stage under normal conditions of development, again brings about the change by which the different molecular structure of the third stage is produced, and so on.

The organization of the species has, on the whole, increased in complexity during the course of phytogeny (genesis or development of the race) and if the phyletic (racial) stages are repeated in the ontogeny, it seems to follow that the structure of the germ-plasm must become more complex in the course of ontogeny instead of becoming simpler. But the complexity of the whole organism is not represented in the molecular structure of any single nucleus, but by that of all the nucleus present at one time. It is true that the germ-cells, or rather the germ-plasm of the germ-nucleus, must gain greater complexity as the organism which arises from it becomes more complex, but the individual nucleoplasms of each ontogenetic stage may become simpler, while the whole mass of idioplasm (germ-plasm) in the organism, which taken together represent the stage in question, does not by any means lose in complexity. If we must, therefore, assume that the molecular structure of the nucleoplasm becomes simpler in the course of ontogeny, as the number of structures which it potentially contains become smaller, it follows that the nucleoplasm in the cells of fully differentiated tissues, such as muscle, nerve, sense-organs, or glands, must possess relatively the most simple molecular structure, for it can not originate any fresh modification of nucleoplasm, but can only continue to produce cells of the same structure, although it does not altogether retain this power.

How do the Germ-cells Arise in the New Organism?—We are thus brought back to the fundamental question as to how the germ-cells arise in the organism. Is it possible that the nucleoplasm of the germ-cell, with its immensely complex molecular structure, specifically containing all the specific peculiarities of an individual, can arise from the nucleoplasm of any of the body cells—a substance which, as we have just seen, has lost the power of originating any new kind of cell, because of the continual simplification of its structure during development? It seems to Weismann that it would be impossible for the simple nucleoplasm of the somatic cells to thus suddenly acquire the power of originating the most complex nucleoplasm from which alone the entire organism can be built up. Weismann can not see any evidence for the existence of a force which could effect such a transformation.

This difficulty has already been appreciated by other writers whose views also depend upon the hypothesis that cells which have once become differentiated for the performance of special functions can not be retransformed into sexual cells. The latter are separated from all other cells at a very early period of embryonic development, before any histological differentiation has taken place.

No Retransformation of Cells to Earlier State.—There is no nucleoplasm like that of the germ-cell in any of the somatic cells, and no one of these latter can be said to be undifferentiated. All somatic cells possess a certain degree of differentiation, which may be rigidly limited to one single direction or may take place in one of many directions. All these cells are widely different from the egg-cell from which they originated. They are all separated from it by many generations of cells, and this fact implies that their idioplasms possess a widely different structure from the idio-

Digitized by Google

plasm or germ-plasm of the egg-cell. Even the nucleoplasm of the two first segmentation nuclei can not possess the same idioplasm as that of the first segmentation nucleus, and it is, of course, far less possible for such an idioplasm to be present in the nucleus of any of the later cells of the embryo. The structure of the germ-plasm must necessarily become more and more different from that of the first segmentation nucleus, as the development of the embryo proceeds. The germ-plasm of the first segmentation nucleus, and of this nucleus alone, is germ-plasm, and possesses a structure such that an entire organism can be produced from it. Many appear to consider it a matter of course that any embryonic cell can reproduce the entire organism if placed under suitable conditions. But when we carefully look into the subject we see that such powers are not even possessed by those cells of the embryo which are nearest to the egg-cell, *viz.*, the first two segmentation spheres. We have only to remember the numerous cases in which one of them forms the ectoderm of the animal, while the other produces the endoderm, in order to admit the validity of this objection.

But if the first segmentation spheres are not able to develop into a complete organism how can this be the case with one of the later embryonic cells, or one of the cells of the fully developed animal body?

Sexual Cells Separated from the Somatic Cells.—The same argument applies to the cells of the embryo itself; and it therefore follows that those instances of early separation of sexual from somatic cells, upon which Weismann has often insisted as indicating the continuity of the germ-plasm, do not now appear to be of such conclusive importance as the time when we were not sure about the localization of the idioplasm in the nuclei. In the great majority of cases the germ-cells are not separated at the beginning of embryonic development, but only in some one of the later stages. A single exception is found in the pole-cells of Diptera. These are the first formed cells in the egg and become the sexual glands of the embryo. Here, therefore, the germ-plasm maintains a true, unbroken continuity. The nucleus of the egg-cell directly gives rise to the nuclei of the pole-cells, and there is every reason to believe that the latter receive, unchanged, a portion of the idioplasm of the former, and with it the tendencies of heredity.

Persistence of a Part of the Germ-plasm, which is Peculiarly Preserved.—But in all other cases the germ-cells arise by division from some of the later embryonic cells, and as these belong to a more advanced ontogenetic stage in the development of the germ-plasm, we can only conclude that continuity is maintained by assuming, as Weismann asserts, that *a small part of the germ plasm persists unchanged during the division of the segmentation nucleus and remains mixed with the germ-plasm of a certain series of cells*, and that the formation of true germ-cells is brought about at a certain point in the series by the appearance of cells in which the germ-plasm becomes predominant. If we accept the hypothesis it does not make any difference, theoretically, whether the germ-plasm becomes predominant in the third, tenth, hundredth or millionth generation of cells. It therefore follows that cases of early separation of the germ-cells afford no proof of a direct persistence of the parent germ-cells in those of the offspring; for a cell the offspring of which becomes partly somatic and partly germ-cell can not itself have the characters of a germ-cell, but it may, nevertheless, contain germ-idioplasm, and may thus transfer the substance which forms the basis of heredity from the germ of the parent to that of the offspring.

Theories of Retransformation and Cyclical Development not Compatible with Apparent Facts.—If we are unwilling to accept this hypothesis, nothing remains but to credit the germ-plasm of each successive ontogenetic stage with a capability of retransformation into the first stage. But the rule of probability is against such a suggestion. Suppose, for instance, that the germ-plasm of the germ-cell is characterized by ten different qualities, each of which may be arranged relatively to the others in two different ways, then the probability in favor of any given combination would be represented by the fraction $(\frac{1}{2})^{10} = \frac{1}{1024}$:

Digitized by Google

that is to say, the retransformation of somatic germ-plasm into germ-plasm will occur once in 1024 times, and it is therefore impossible for such retransformation to become the rule. It is also obvious that the complex structure of the germ-plasm which potentially contains, with the likeness of a faithful portrait, the whole individuality of the parent, can not be represented by only ten characters, but that there must be an immensely greater number; it is also obvious that the possibilities of the arrangement of single characters must be assumed to be much larger than two; so that we get the formula $(\frac{1}{p})\,n$, where p represents the possibilities and n the characters. Thus if n and p are but slightly larger than we assumed above, the probabilities become so slight as to altogether exclude the hypothesis of a retransformation of somatic idioplasm into germ-plasm.

It may be objected that such retransformation is much more probable in the case of those germ-cells which separate early from the somatic cells. Nothing can, in fact, be urged against the possibility that the idioplasm of, *e. g.*, the third generation of cells may pass back into the condition of idioplasm of the germ-cell; although, of course, the mere possibility does not prove the fact. But there are not many cases in which the sexual cells separate as early as the third generation, and it is very rare for them to separate at any time during the true segmentation of the egg. In most cases separation takes place at a very late stage. In such cases the chances of retransformation become infinitely small.

If it could be proved that development is not merely in appearance but in reality a cyclical process (as Minot's theory is) then nothing could be urged against the occurrence of retransformation. The phyletic development of the whole organic world clearly illustrates a development of direct non-cyclical course, or at all events courses in which the earliest condition is not repeated at the close of development. The phyletic development of the whole organic world clearly illustrates a development of the latter kind, for, although we assume that organic development is not nearly concluded, it is, nevertheless, safer to predict that it will never revert to its original starting point, by backward development over the same course as that which it has already traversed. No one can believe that existing placental mammals will develop into marsupiatia, monotremata, mammal-like reptiles, and the lower vertebrate forms into worms and finally into monera. How then, could a process which seems to be impossible in phylogeny occur as the regular method of ontogeny? Besides, we have to ask for proofs of the actual occurrence of cyclical development.

Development is Progressive not Retrogressive.—If the appearance of the whole cell gives us any knowledge as to the structure of its nuclear idioplasm, we may be sure that the development of a primitive germ-cell proceeds without a break, from the moment of its first recognizable formation to the ultimate production of distinct male or female sexual cells.

Parent Germ-cell from First Separated into Body and Germ-cells.—In animals the germ-cells are separated from the somatic cells during embryonic development, sometimes even at its very commencement, and it is obvious that this latter is the original, phyletically oldest, mode of formation.

The sexual differentiation of the germ-cells is not material to the question being now discussed; the important point is to ascertain whether the germ-cells, sexually differentiated or not, arise from the somatic cells *at the end of ontogeny*, or whether the substance of the parent germ-cell, during embryonic development, is from the first separated into somatic and germ-cells. The former interpretation would be against Weismann's view, the latter in its favor. The germ-cells of *Volvox* are differentiated during embryonic development—before the escape of the young organism from the egg capsule. The germ-plasm must have become modified in molecular structure during the course of phylogeny, so that the cells produced were no longer made up of identical units, but of two different kinds. After this separation, the germ-cells alone retained the power of producing similar cells by division. Thus *Volvox* seems to afford direct proof

Digitized by Google

at in the phyletic origin of the hetero-
asted groups, somatic cells were not
tercalated between the mother germ-
ll and the daughter germ-cells in each
togeny, but that the somatic cells arose
rectly from the former, with which
ey were previously identical. Thus
e continuity of the germ-plasm is es-
blished at least from the beginning of
e phyletic series of development.

*In Higher Organisms Period of This
eparation has been Gradually Changed.*
—The fact that in most higher organisms
e separation of the germ-cells takes
lace later, and often very late, at the
d of the whole ontogeny, proves that
e time at which this separation of the
o kinds of cells took place must have
en gradually changed. In this respect
e well-established instances of early
paration are of great value, because
ey serve to connect the extreme cases.
is quite impossible to maintain that
rtain germ-cells exist from the time of
mbryonic development, as indifferent
lls, which can not be distinguished from
hers, and which are only differentiated
a later period. It is obvious that
one of the relatively few cells of the
mbryo can be excluded from the
normous increase by division, which
ust take place in order to produce the
rge number of daughter individuals.
is therefore clear that all the cells of
e embryo must for a long time act as
matic cells, and none of them can be
served as germ-cells and nothing else.

Strictly speaking, Weismann says he
ll into an inaccuracy in maintaining in
rmer works that the germ-cells were
emselves immortal; they only contain
e undying part of the organism—the
rm-plasm—and although this substance
as far as we know, invariably sur-
unded by a cell-body, it does not al-
ays control the latter, and thus confer
pon it the character of a germ-cell. This
dmission does not materially change
Weismann's view of the subject. If the
ature and character of a cell is de-
rmined by the substance of the nucleus
nd not by the cell-body, then the im-
ortality of the germ-cells is preserved,
lthough only the nuclear substance
asses uninterruptedly from one genera-
n to another.

Germ-cells only Produced by Certain Cells Predestined for the Purpose.—The germ-cells can not be indeed produced by any indifferent cells of embryonic character, but by certain cells, and under circumstances which allow us to positively conclude that they have been predestined for this purpose from the beginning. In other words the cells in question contain germ-plasm, and this only enables them to become germ-cells.

As a result of his investigations on Hydroids, Weismann concluded that the germ-plasm is present in a very finely divided and therefore invisible state in certain somatic cells, from the very beginning of embryonic development, and that it is then transmitted through innumerable cell-generations to those remote individuals of the colony in which sexual products are formed. This conclusion is based on the fact that germ-cells only occur *in certain localized areas* in which neither germ-cells nor primitive germ-cells (the cells which are transformed into germ-cells at a later period) were previously present. The primitive germ-cells are also only formed in localized areas, arising from the somatic cells of the ectoderm.

The place at which germ-cells arise is the same in all individuals of the same species, but differs in different species. Such differences correspond to different phyletic stages of a process of displacement, which tends to remove the localized area from its original position in centripetal direction, which takes place by the frequently round-about method of the migration of primitive germ-cells. We are thus obliged to conclude that such is the only manner in which the change can be effected, and the other cells are unable to play the role of primitive germ-cells. And if other cells are unable to take this part it must be because nucleoplasm of a certain character has to be present in order to form germ-cells or according to the terms of the theory, the presence of germ-plasm is indispensable to this purpose—that there is a continuity of the germ-plasm.

We must now give Weismann's theory as to the *significance of the polar bodies*, which is of great importance to understand.

Google

Two Kinds of Nucleoplasm.—The growing egg-cell must possess nucleoplasm of a specific molecular structure which directs the "secretory" functions of the cell as demonstrated by the expulsion of the polar bodies. The nucleoplasm of histologically differentiated cells may be called histogenetic nucleoplasm, and the growing egg-cell must contain such, asserts Weismann, and also a specific modification of it. It can not be the same as that which, at a later period, causes embryonic development. That can only be produced by true germ-plasm of immensely complex constitution. "It therefore follows" that the nucleus of egg-cells contains two kinds of nucleoplasm, *viz.*: (*a*) *Germ-plasm*, and a peculiar modification of histogenetic nucleoplasm which may be called (*b*) *ovogenetic nucleoplasm*. This latter must preponderate in the growing egg-cell, for it controls the growth of the latter—minute at first, but increasing in growth, so that the germ-plasm may control the cell the preponderating ovogenetic nucleoplasm must be removed from the cell. This removal takes place as seen in the first expulsion of polar bodies—which is nothing more than a removal of ovogenetic nucleoplasm from the egg-cell—being thence of no more use.

Weismann admits that his theory must stand or fall with this explanation—of the presence of two kinds of nucleoplasm in the nucleus. And this not only refers to the female, but also to the male, nucleus. In the latter are germ-plasm and spermatogenetic nucleoplasm.

Their Function.—These two kinds of nucleoplasm exert opposite tendencies in at least one respect. The germ-plasm tends to effect the division of the cell into the first two segmentation spheres; the ovogenetic nucleoplasm, on the other hand possesses a tendency to growth of the cell-body without division. Hence the germ-plasm can not make itself felt, and is not able to expel the ovogenetic nucleoplasm until it has reached such a relative size as enables it to successfully oppose the latter.

The process of expulsion is evidently a remnant of an ancient phyletic stage which must possess exceedingly important physiological (and perhaps morphological) significance.

According to the above views the polar bodies—true cells, and the egg-cell, are different in kind, for as in the division of the nuclear spindle two qualitatively different daughter nuclei are produced, because they are different in purpose or function.

Should it finally be proved that the expulsion of the polar bodies is nothing more than the removal of histogenetic nucleoplasm from the germ-cell the opinion that a retransformation of specialized idioplasm into germ-plasm can not occur, would be confirmed.

No part of one organism is thrown away simply because it is useless—portions that have lost their substance are absorbed and used in building up the organism.

The expulsion of the first polar body then means the removal of the histogenic part of the nucleus. This is the maturing part of the egg-cell.

Parthenogenetic eggs form only one polar body, while eggs requiring fertilization form two polar bodies. Parthenogenesis depends upon the fact that the part of the nucleus which is expelled from the sexual egg in the second polar body remains: that is when the whole of the ancestral germ-plasms inherited from the parents are retained in the nucleus of the egg-cell.

Development by fertilization makes it necessary that half the number of these ancestral germ-plasms must be first expelled from the egg, *the original quantity being again restored by the addition of the sperm nucleus to the remaining half.*

In both cases the beginning of embryo-genesis *depends upon the presence of a certain, and in both cases equal, quantity of germ-plasm.* This certain quantity is produced by the addition of the sperm-nucleus to the egg requiring fertilization, and the beginning of embryo-genesis immediately follows fertilization. The parthenogenetic egg contains within itself the necessary quantity of germ-plasm, and the latter enters upon active development as soon as the single polar body has removed the ovogenetic nucleoplasm. The parthenoge-

Digitized by Google

netic egg is thus capable of development immediately after the expulsion of the "first" polar body.

The expulsion of the second polar body means the reduction of the ancestral germ-plasms. This reduction applies to the male as well as the female nucleus. This material is reproductive and is concerned in the work of heredity.

The ideas thus developed lead to remarkable conclusions with regard to the theory of heredity—conclusions that do not harmonize with the ideas on this subject hitherto received.

Why Hereditary Tendencies Vary.—For if every egg expels half the number of its ancestral germ-plasms during maturation, the germ-cells of the same mother can not contain the same hereditary tendencies, unless of course we make the supposition that corresponding ancestral germ-plasms are retained by all eggs—a supposition which can not be sustained. For when we consider how numerous are the ancestral germ-plasms which must be contained in each nucleus, and further how improbable it is that they are arranged in precisely the same manner in all germ-cells, and finally how incredible it is that the nuclear thread should always be divided in exactly the same place to form corresponding loops or rods—we are driven to the conclusion that it is quite impossible for the reducing division of the nucleus to take place in an identical manner in all the germ-cells of a single ovary, or that the same ancestral germ-plasm would always be removed in the polar bodies.

But if one group of ancestral germ-plasms is expelled from one egg and a different group from another egg, it follows that no two eggs can be exactly alike as regards their contained hereditary tendencies or influences; they must all differ. In many cases the differences will only be slight, that is, when the eggs contain very similar combinations of ancestral germ-plasms. Under other circumstances the difference will be very great, *viz.*, when the combinations of ancestral germ-plasm retained in the egg are very different. The consequences which follow from this theory upon the second division of the egg-nucleus, and the formation of the second polar body, are by no means opposed to the facts of heredity, and even explain them better than has hitherto been possible. Weismann then advances the remarkable facts as to the likeness of twins in support of his theory, which may be better retained for some future occasion. The above is an important part of Weismann's elaborate system of theories. The reader should fully comprehend his meaning.

In Each Generation the Ancestral Germ-plasms are Doubled in Number, but Similarly Reduced in Quantity.—Weismann thus looks upon the second polar globule, by which the germ-plasm is reduced one-half, as a reduction not only in quantity but above all in complexity of constitution; for by this means, he reasons, the excessive accumulations of different kinds of hereditary tendencies or germ-plasms is prevented, which, without it, would necessarily be produced by fertilization. With the nucleus of the second polar body as many different kinds of germ-plasms are removed from the egg as will be afterward added through the contribution of the sperm nucleus. This may be made more clear by the following explanation:

Suppose we imagine an organism in which sex has just arisen and wherein we thus have fertilization for the first time. In the egg-cell resulting from this fertilization we should have mingled with the germ-plasms of but two parents (or but two kinds of chromatin in the nucleus, the chromatin, be it remembered) being the physical material to which all such phenomena are traced. This daughter organism now congregates with another similar individual which is also but one generation removed from the sexual origin. In the organism resulting from this union, we consequently have commingled in the germ-plasms (chromatin elements), four ancestral tendencies. Obviously the next generation, from a similar union to the immediately preceding, would contain eight ancestral germ or idioplasms, the next sixteen, the tenth generation 1,024, and so on, doubling each time with every sexually produced generation. This is but following the well-known calculation made by breeders who differ only in using the term *blood, half blood, quarter blood, three-*

quarters blood, etc., instead of ancestral germ-plasms, etc. While in each succeeding generation the number of germ-plasms are doubled, their quantities are reduced by one-half. Thus in a series of generations the continually recurring divisions of the ancestral germ-plasms must theoretically, ultimately reach a limit.

So Weismann argues that the reduction in the number of chromatin loops accomplished by the formation of the second polar globule is to reduce, by one-half, the number of the ancestral germ-plasms in the ovum, and the ancestral germ-plasm added by the spermatozoon brings the number of germ-plasms in the ovum up to the normal number which he supposes to be present. The theory is based on the almost universally accepted one that fertilization consists in that *an equal number of chromatin loops from either parent* are placed side by side and form the new segmentation nucleus.

After this stage is accomplished no further alteration can be made or influence felt in the future development of the individual. In fact, *the son is father of the man.* Thencefrom—

"'Tis in ourselves that we are thus, or thus."

The Important Conclusions to be Specially Remembered.—From the preceding facts and considerations the important conclusion results that (1) *the germ-cells of any individual do not contain the same hereditary tendencies, but are all different*, in that no two of them contain exactly the same combinations of hereditary tendencies. On this fact the well-known differences between the children of the same parents depend.

But the deeper meaning of this arrangement must doubtless be sought for in (2) *the individual variability which is thus continuously kept up* and is always being forced into new combinations.

Thus *sexual reproduction* is to be explained as an arrangement which ensures an ever-varying supply of individual differences.

RELATIONS OF THE THEORY TO GENERAL EVOLUTION.

II.—*Such Variability Alone Transmissible.*—The variability thus induced by the ever possible difference in combinations of the ancestral germ-plasms of the segmentation nucleus is the only variability that, according to Weismann, is hereditarily transmitted. All other variability, morphological or physiolgical, etc., that occurs in the individual subsequent to the fusion of the segmentation nucleus, and through the life of the individual, is absolutely *non-transmissible.* The tremendous significance of this view will have to be more fully discussed. The main "fact" of the theory we wish here to bring out is this: "That if variability is confined to the simple possible differences of arrangement of the molecularly complex germ-loops, the organized material of these has been practically the same from generation to generation backward, in regard to all living beings that reproduce themselves sexually"—as it was in the beginning, is now.

These variations of Weismann, congenital variations, as they are called, depend for their appearance on sexual modes of reproduction. *Therefore no organisms which propagate themselves by asexual means can present congenital variations* or thus become subject to the influence that favors their perpetuation.

Uni-cellular and Multi-cellular Organisms.—How then can the theory account for the individual variation, and origin of the species of all uni-cellular asexual living organisms? Weismann accounts for both by the direct action of external conditions of life—whose influence he denies in the multi-cellular or sexual organisms. In the uni-cellular he allows the effect of use and disuse, etc., in the multi-cellular organisms he disallows this.

He claims logical consistency herein. For the conditions of propagation among the uni-cellular organisms are such that parent and offspring are one and the same thing—"the child is a part, usually a half, of its parent." Therefore, if the parent has been in any way modified by the action of external conditions, it is inevitable that the child should, from the moment of its "birth"—fissiparous separation—be similarly modified; and if the modifying influences continue in the same lines for a sufficient length of

Digitized by Google

me, the resulting change of type may ecome sufficiently pronounced to con-itute a new species, genus, etc.

But in the case of multi-cellular or xual organisms the child is not thus erely a severed moiety of its parent; it the result of the fusion of two highly pecialized and extremely minute particles f each parent.

"Immortality" of Uni-cellular Organ-ms.—Going back now to the uni-cellular rganism, we know that "reproduction" as simply a more or less equal fission which each of the new halves con-nued the former life of the parent grow-g into two mature individuals, to repeat perpetuity themselves in the next ssiparous progeny. Hence here, in hese uni-cellular beings, there never is ny death on the part of their protoplas-ic material. Weismann, therefore, rgues that here, aboriginally and poten-entially, life is immortal.

The Addition of Sexual Reproduction.—If such is the case in such organisms hy is the case so different in multi-cel-ular? Weismann points out that in these e have the additional phenomena of re-roduction by the fusing of two minute nd specialized portions of two (parent) rganisms—sexual reproduction.

[As to the explanations given of the rigination of this new method Weis-nann seems to be at variance with him-elf.]

Mortality of Such Multi-cellular Organ-sms.—It is evident, according to Weis-nann, that with this new and novel hange in the method of propagation, erious disadvantage would accrue to any pecies if its sexual individuals were to ontinue to be immortal. For in that ase every species which multiplies by exual methods would, in time, become omposed of individuals broken down nd decrepit through the results of acci-lent and disease—always operating and ver accumulating throughout the course f their immortal lives.

Consequently, as soon as sexual meth-ds of propagation superseded the nore primitive asexual methods, it be-ame desirable in the interests of the sex-ally propagating species that their con-tituent individuals should cease to be nortal, that the species should always be recuperated by fresh, young and well-formed representatives.

Consequently, also, natural selection would speedily see to it that all sexually propagating species should become de-prived of the original endowment of im-mortality, with the result that death is now a universal destiny among all the individuals of such sexually reproduced species.

But This Mortality Does not Extend to the Germ Material.—Nevertheless, it must be remembered that, according to Weismann's theory, this destiny extends only to the parts of the individual other than the contents of these specialized cells which constitute the reproductive elements, for, although in each individual that is sexually reproduced an innumer-able number of these specialized cells are destined to perish during the life and with the death of the organism to which they belong, this is only due to the acci-dent, so to speak, of their contents not having met with their complements in the opposite sex. It does not belong to their essential nature that they should perish, seeing that those which do hap-pen to meet with their complements in the opposite sex help to form a new liv-ing individual, and so on through suc-cessive generations to infinity. There-fore, the reproductive elements of the sexually reproduced are, in this respect, precisely analogous to the immortal asexually reproduced—if they die their death is similarly an accident due to un-favorable circumstances.

But the case is, according to the theory, quite different with all other parts of a multi-cellular organism. Here, no mat-ter how favorable the circumstances may be, every cell contains within itself, or in its very nature, the eventual doom of death. Thus, among sexually repro-duced organisms it is the specialized germ-plasms alone that retain their prim-itive endowment of everlasting life, passed on continuously through genera-tion after generation of successively per-ishing organisms.

This Mortality of the Soma Correlated with Reproduction.—"So far, it is con-tended, we are dealing with matters of fact." It must be taken as true, re-marks Romanes, that the protoplasm of

Digitized by Google

the uni-cellular organisms and the germ-plasm of the multi-cellular organisms have been continuous since life first appeared on the earth. And although large quantities of each are perpetually dying through being exposed to conditions unfavorable to life, this, as Weismann presents the matter, is quite a different case from that of all the other constituent parts of multi-cellular organisms, which contain within themselves the doom of death.

Furthermore, it appears very probable that this doom of death has been brought about by natural selection, for the reason that it is for the benefit of all species which perpetuate themselves sexually that their constituent individuals should not live longer than is necessary for the sake of originating the next generation and fairly starting it in its own struggle for existence. Weismann has, indeed, shown that there is, throughout the division of organisms we are speaking of, a general correlation between the natural life-time of individuals composing any given species and the age at which they reach maturity or first become capable of procreation. This general correlation is somewhat modified by the time during which progeny are dependent upon their parents for support and protection. Yet it is evident that this modification tends rather to confirm the view that expectation of life on the part of individuals has in all cases been determined with strict reference to the requirements of propagation—if under this term we include the rearing as well as the production of offspring.

We have come then to these *results:* Protoplasm was originally immortal, barring accidents, and it still continued to be immortal in the case of uni-cellular organisms which propagate asexually. But in the case of multi-cellular organisms, which propagate sexually, natural selection has reduced the term of life within the limits that in each given case are compatible with the performance of the sexual act and the subsequent rearing of progeny, reserving, however, the original endowment of immortality for the germinal elements, whereby a continuum of life has been secured from the earliest appearance of life until the present day. These equal methods became so universal to allow of and furnish these infinite number of congenital variations for natural selection to act on.

These congenital variations, therefore, are offering themselves to the ever alert agency of natural selection (a name for some power more easily assumed than explained). We are, however, sufficiently able to understand how possible it is for the two contributions of the germinal elements to offer these variations.

Hence the agency of natural selection *does not go beyond* the sexual or multi-cellular organisms; among the asexual it can not exercise any influence at all—is without any jurisdiction. Weismann accounts for variation in these *to the direct action of external conditions.*

In the variations possible in the sexually reproduced organisms natural selection is continually picking out and putting on probation such characters as it prospectively feels, *sic,* in the germ-plasm —when fully developed into a resulting organism—will give that organism the best chance for its struggle for existence.

A certain over-supply of this combination of germ-plasm, intrusted to that organism for bequeathing to the next generation, this to the next, and so on, it follows that natural selection is all the while conserving that originally peculiar combination of germ-plasm, until it happens to meet with some other mass of germ-plasm by mixing with which it may still further improve upon its original peculiarity; when, of course, natural selection will seize upon this improvement to perpetuate as in the previous case. So that we may say that natural selection is watching and waiting for such combinations of germ-plasm as will give the resulting organisms the best possible chance in their struggle for existence, while at the same time it is remorselessly destroying all those combinations of germ-plasm which are handed over to the custody of organisms not so well fitted to their condition of life.

These combinations, according to the theory, when once effected are so stable that they never alter *except* as a result of forming further new combinations. This means that no external influences or in-

Digitized by Google

ternal processes can ever change the hereditary nature of any particular mixture of germ-plasm, which, being equally stable, goes to unite with the other in equal proportions as regards hereditary character — the germ-plasm does not change when it is mixed with some other mass.

Consequently, no matter how many generations of organisms there may have been, and, therefore, no matter how many combinations of germ-plasm may have taken place to give rise to any contemporary population of animals, each existing unit of germ-plasm *must have remained* of the same essential nature of constitution *as when it was originally started* in its immortal career millions of years ago—when it *first* existed in simple multi-cellular structures.

Origin of Differences of Character of Germ-plasms.—As it is an essential, because a logically necessary part of the theory, to assume such absolute stability or unchangeableness on the part of germ-plasm, the question arises, and has to be met—What was the origin of those differences of character in the different germ-plasms of the multicellular organisms which first gave rise, and still continue to give rise, to congenital variations by their admixture one with another? This is answered *by supposing* that differences orignally arose out of the differences in the uni-cellular organisms, which were the ancestors of the multi-cellular organisms. As before stated different forms of uni-cellular organisms are supposed to have originated as so many results of differences in the direct action of the environment. Consequently, according to the theory, all congenital variations which now occur in multi-cellular organisms are really the distant results of variation that were aboriginally induced in their uni-cellular ancestors by the direct action of surrounding conditions of life.

We would here again bring out the fact of this theory that: In regard to the unicellular organisms it admits only the influence of use and disuse, environment, external conditions. In regard to multicellular, it admits only the influence of natural selection on the variously presented congenital combinations. The first admits alone what is known as Lamarkian principles; the second, alone Darwinian.

III.—*Heredity and Variability.*—The theory therefore endeavors, in the grand results of evolution, to give us a satisfying explanation really of natural selection. This has been described as heredity modified and influenced by variability. Heredity is defined as the perpetuation of the like; variability of the production of the unlike. Heredity is a constantly active agency; variation is a constantly possible occurrence. Variations upon their occurrence are transmitted by heredity, hence the above definition as given by Turner.

Acquired Characters.—*Variation* as herein understood must now be more particularly determined. It is necessary therefore to enquire into the origin of "acquired characters," which exhibit the tendencies of variation.

Whether they originate *either* in such molecular changes in the germ-plasm, as may meantime be called spontaneous or fortuitous, leading to such alteration in it as may produce a new variation; *or* in the life experience of the individual itself, "accidentally" due to habits, environment, etc.

The first, taking place in the germ-plasm, are termed blastogenetic or congenital. The second taking place in the body cells are termed somatogenetic or individual.

For example, a horse may be born blind, or he may acquire such condition, or subsequently develop it, in consequence of some particular individual experience as a result of accident or other cause.

In the former case, arising supposedly as a result of a certain "chance" arrangement of the germ-plasms, *i. e.*, congenitally, it is certain, according to the Weismannian theory, to be transmitted by the power of heredity possessed by the germ-plasm. In the latter case, it is as "certain," according to the theory that it can not be transmitted to the offspring.

This is a purposely supposititious illustration for the sake of giving a more direct accentuation to the theory. We are not to discuss such cases now, that may be done more appropriately subse-

Digitized by Google

quently. It is mentioned here to contrast it with former beliefs: That a certain character (being developed individually continuing to appear influenced in such direction by external means, more strongly in successive generations) which was apparently at first only a sport, becomes endowed with hereditary force and would be as surely transmitted as any character originating in the embryo (congenitally) itself.

This is the great "assumption" the validity of which is being so ruthlessly assailed by Weismann and his followers. It has been around this particular point —of the transmissibility or non-transmissibility of somatogenetic or individually acquired characters—that the hottest of the battle has raged. It has been made a "test" of the theory. It is really the Weismannia of the present day. It is the rock upon which evolutionists have split.

The Weismannian theory is that the somatogenetic cells or influences effecting them make no impression on the blastogenetic cells, that indeed there is a continuous distinction—isolation—of the latter from the former; the theory which this opposes, assumes the reverse.

Now the above constitute the views the holders of which seek to adduce facts to prove pure Lamarkism and pure Darwinism. Respectively these involve, in contrast (*a*) the effect of use and disuse, etc., in inducing gradual changes in the body organs; and (*b*) the effect of natural selection or spontaneous changes in the germ-plasm.

Lamark's view in this regard are expressed thus:

All that has acquired, impressed or altered in the organization of individuals during the course of their life is preserved by generation and transmitted to the new individuals which spring from those which have experienced these changes.

Darwin's latest view is that evolution is due to the natural selection of such congenital variations as favored survival, supplemented by the transmission of acquired characters.

But Weismann denies the latter supplement *entirely*, and attributes evolution to the natural selection of the individuals which bear the most favorable variations of the germ or reproductive cells. Variation he ascribes, we have seen, to the constant union in the germ-plasm of plasmata from different lines of descent in fertilization, these variations being constantly acted upon by natural selection to produce new types. "He thus revived Darwin's earlier views of evolution," and thus it is from English naturalists that this theory has received such persistent advocacy as well as criticism.

In the foregoing we have stated Weismann's theory in its bearings on heredity and evolution. We have excluded all criticism of it, so as to present it as it is and can be understood. Perhaps no theory as this has excited so much interest and caused so much criticism since the promulgation of the theory of evolution itself by Darwin.

St. George Mivart, one of its severest critics, describes it as "the best theory of heredity that has ever been presented to science." All who have subjected it to criticism admit its great value. Most critics are ready to accept so much of it. To pure naturalists it seems to be almost thoroughly acceptable as explaining nature's intent. Weismann is a pure naturalist. If he had been a pathologist, perhaps he would not have been so absolute in his denials of somatic influence.

Many of the most authoritative biologists share thoroughly in this view. But many are as determined in their belief that "profound changes due to function or environment may saturate through the organism and affect the reproductive cells and thus the race." [J. A. Thomson. "Outlines of Zoology."]

A sound theory of heredity has been in science a long-felt want. "As Weisman has employed," says Sir W. Turner, "in his elucidation a phraseology which is more in harmony with that generally used by biologists, his theory has had a more immediate attention given to it" than others which evidently contained the same germs. Therefore, as an interpretation of the facts developed by our latest discoveries in embryogenesis, this theory —reviving and giving precision, as it does, to the views of such thinkers as have been concerned in developing the theory of natural selection—comes at an

Digitized by Google

portune time to be welcomed with open ms.

Whatever differences of opinion or iticism it may give rise to or receive, we el that out of it will eventually be endered a theory of heredity which will ecome acceptable to the majority. We ccept it not, possibly, as wholly correct, at as a basis of correction.

In our two articles on this subject we ave given the latest discovered facts and eveloped theories. There is evident oom in each line for further discovery nd correction. The more precise our facts become, the more decisive, also, will be our theory. In the meantime both are acting as spurs to our greater enlightenment and satisfaction.

Especially will we endeavor to point out its bearings in regard to the development and improvement of the domestic animals we are more particularly attached to, and discuss in what way its radical and revolutionary dicta affect, hereditarily, the individuality of a peerless Nancy Hanks as developed by the personality of an unequaled Budd Doble.

THE PHILOSOPHY OF THE TROTTING STRIDE.

BY JOS. CAIRN SIMPSON.

DITOR WALLACE'S MONTHLY:

DEAR SIR:—In these piping days of recrd smashing, perpetual-motion wheels, nd lively essays, which have for a xt the better management of trotting ices, there is little time for giving atntion to abstruse questions, or ponderig over as recondite a subject as that hich is known by the above caption. t least to one who is so busily engaged om early morning until Mount Tamalais throws a lengthened shadow across he bay, that the post prandial and afterinner smokes give about the only leisre daylight minutes to glance over the cord of passing events, and those have een of such a startling kind in the troting and pacing world as to astonish, ery nearly bewilder, us old-timers who an readily recall the days when 2:31 as *the* record. In "tackling" it now I ay as well explain why the trotting tride is made the subject of this paper. When the MONTHLY comes I read the ditorials and whatever it contains of imediate interest, and lay it by for closer ttention when the nights are longer and hen the subjects embraced are more in ccordance with my train of thoughts. The "handy shape" of the MONTHLY akes it peculiarly appropriate for nture reference. The weekly journals emand closer attention, and if there is nything in them which will be wanted ereafter a note is made and the paper id away in a place that of itself designates its importance. Fortunately the turf papers I read are received in a straggling way, the *Horse Review* Monday morning, the *Horseman* Tuesday, Wednesday and Thursday the New York *Spirit of the Times*, the *American Sportsman* and the *Kentucky Stock Farm*. The last named on the very first page of reading matter had an article headed as above, and, of course, it should be read, or, at least, skimmed, to see whether it must go into the compartment provided for closer attention hereafter. The article covered more than one page, and on turning the leaf found that it was credited to "S. T. H. in WALLACE'S MONTHLY." With that knowledge I thought that it must be that a mistake had been made in reading and that my understanding was at fault. Back to the first page and re-read. Then again, and to be sure, clipped portions from the page, and, after mucilaging them to a sheet, read once more, and then was forced to the conclusion that Nancy Hanks, Hal Pointer, Jay-Eye-See, Martha Wilkes, and all of the other disturbing elements had twisted the trotting stride so completely out of its true shape that the author had lost his mental equilibrium, and that the editor who first published, and the one who copied it, had placed their dependence on a great name, deservedly great, for S. T. H. has written very many good things, and took it for granted that it was cor-

Digitized by Google

rect. So far from being the fast trotting stride, it is surprising to me that in the elaborate reasoning which followed these false premises its falsity was not discovered.

Inasmuch as it is very important to the student of trotting action to know the true, fast trotting stride, I send you this, and if not clearly and distinctly proven that S. T. H. is in error send it back. I have neither the time nor inclination to review the whole article, as it is beyond question, that with wrong hypotheses to build upon the reasoning can not be logical and therefore the deductions incorrect. Here are the clippings, a small part of the article, but necessary to understand the author's position:

The reinsman was requested, at first, to walk him. The footprints plainly showed that the hind feet did not extend as far forward as the front ones by about six inches. Then he was slowly jogged, and the footprints, to the surprise of the spectators, changed. The hind feet extended as far front as the forward feet, but just outside of the impressions of the fore feet. The jog-trotting was as square and beautiful as the most fastidious horsemen would desire, with the single exception that there was too much spread at the stifles and elevation of the hind action. When he was urged up to his speed, then the hind feet extended fourteen inches beyond his front feet and, then only, his trouble began in earnest. Palpably his propulsion was in excess of his carrying capacity. This did not result from the preponderance of his power in the hind quarters, embracing the coupling, hips, stifles and gaskins, over the forearm; for he is proportionally as strong in front as he is behind. But the fore limbs being too short and thus out of balance with the unduly extended leverage of the hind quarters, are overtrotted by the hind feet just fourteen inches at every stride. They thus work at a disadvantage, *too far under the body*, which makes it extremely difficult for them to sustain the carcass when the momentum becomes extreme.

* * * * * * *

The third performer was the beautifully gaited veteran Schuyball, record 2:26½, but whom the writer recently timed a mile in 2:19 in his seventeenth year. When he came out for the inspection of his action every spectator remarked that his gait was perfect, and that description answered exactly, so far as the length of his stride is concerned. He *walks and jogs and trots precisely in the same footprints.* His action, therefore, is perfectly balanced. There is no over-reaching, no undue widening, no interference. He moves without protecting boots, without rolling, or weaving, or twisting his body. The carcass seems to be at rest. The movement seems to be confined exclusively to his limbs and feet. He therefore rarely leaves the trot, even when forced by voice and whip up to tiptoe speed. So far as the *length* of his stride is concerned, and the perfect placement of all his feet at every footfall is considered, his action is perfect. He is a line trotter, and therefore loses no muscular force in undue width. The only lost motion is in the excessive height of his action. If he moved close to the ground, as the Electioneers do, to their base of action, his speed would have been increased with the expenditure of the same muscular power several seconds.

From this observation it is apparent that even when the hind and front feet on the same side land in the same place the action may not be perfect. The stride may be of the proper length to correspond with the length of the carcass and with the relative extension of the propelling muscles of the fore and hind parts, but if there is any lost motion, just in so far is there present a constant hindrance to the greatest speed. When the trotting action is a balanced stride, making but two impressions, and there is no lost motion, then the speed becomes phenomenal and steadiness is merely a question of condition. Axtell and Nancy Hanks and Arion and Sunol and Maud S. are of this perfect type. Their action answers to all the requirements of this critical analysis. But there are very few whose trotting movement is thus absolutely precise. Contrary to the general impression, when the stride is quickened as the speed is increased, its length is not shortened, but both quickened and lengthened. In the purview of these observations and measurements, how crude seems to be the conclusion that there is nothing in trotting form, but the whole question revolves around the vague misnomer of "trotting instinct." There are many peculiarities in the trotting stride. Some horses overlap the front footprints when jogging or speeding. Others walk in the same steps, but overlap with the hind feet when both jogging and speeding. Still others will walk in the same steps, overlap when jogging, and bring the hind and front prints together when moving rapidly.

From this quotation it is evident that the author imagines, that "when the hind and front feet on the same side land in the same place," it is the fast trotting stride, although he closes the sentence with the words, "the action may not be perfect."

The only true trotting stride which will comply with the requirements, is when the animal is jogging. With a number of diagrams of the fast-trotting stride, I was without one which illustrated this phase of trotting action, and to-day took a horse to the track to obtain a practical result. A young mare with great length

body and limbs it was difficult to gauge
jog when the hind foot fell exactly in
print made by the fore foot, but this
close enough to show:

Stride 8 feet 10 inches.

4 feet 5 inches. * * 4 feet 5 inches. * *

Right fore foot. Right hind foot

Left fore foot. Left hind foot.

The footprints were not in line, being
out as far apart as the feet would be
hen the mare stood in a natural posi-
n. After the measurements of the
ging stride were made she was moved
out a three-minute gait and the foot-
ints were more nearly in line and
aced thus—the scale one-half of that
ed in the jog:

Stride 15 feet.

3 ft. 6 in. * 4 feet. * 3 ft. 6 in. * 4 feet. *

Right fore. Right hind. Left fore... Left hind..

The filly which made the trial is a
anddaughter of Electioneer, and has
e typical gait of the family. She wore
s in front, shoes behind, so that there
s no trouble in distinguishing the foot-
arks. It will be noticed that even at
is comparatively slow rate of speed,
rtainly not faster than a 2:50 gait, the
ortest space is between the hind and
re, proving that the hind foot is thrust
rther in advance of the fore foot than
was behind, and in the diagrams which
ll follow this will be more clearly illus-
ated. By referring to the first para-
aph quoted from the article under
view, describing the action of the
Ilkes horse will be found: "When he
s urged up to his speed, then the hind
et extended fourteen inches beyond his
ont feet and, then only, his trouble
gan in earnest. Palpably his propul-
on was in excess of his carrying capaci-
." It is safe to assert that a horse
hich only advanced his hind feet four-
en inches beyond his front feet would
t trot in four minutes, and the mistake
ust have been made by taking the foot-
int of the fore foot for that of the hind
t, and in reality the "propulsion" was
so great as to bring the hind foot to the ground just fourteen inches behind where the front foot rested. This will be clearly apparent from appended diagrams.

They are copied from *The Horse in Motion*, the cuts in that being an exact reproduction from the instantaneous photographs taken at Palo Alto. A brief explanation of the system pursued will be necessary for a correct understanding. For the present purpose it is sufficient to state that lines were drawn across the track twelve inches apart, twenty-four of these lines, twenty-four cameras ranged on one side of the track each one foot apart. On the opposite side were two sets of figures—one set from 1 to 24, corresponding to and exactly opposite to the cameras, still further back a series from 1 to 42, No. 12 being in conjunction with camera No. 1, the first line across the track and the figure 1 in the first series of figures, and 36 of the second series opposite 24 and camera belonging to 24. The cameras operated automatically and every foot of the stride is represented. Thus the left hind foot of Elaine is shown by camera 2 to be on line 12, the right fore foot by camera 3 to be on line 16, four feet between toe and toe of the supporting feet. The toe of the right-hind foot is shown by cameras 11 and 12 to be slightly in advance of line 20, the left fore foot on cross line 25, one-half of the stride 9 feet 1½ inches. The completion of the stride by camera 20, when the left hind foot is brought down over line 29. The tape-line measurement and the cameras in accord.

On this one plate there are twenty-four figures showing the position of limbs and feet at every portion of the stride, and is the only complete elucidation of the trotting stride. To give a full and distinct description without the use of plates is entirely out of the question. Still, I think that the diagrams will be sufficient to prove beyond all cavil that fast trotters progress in the manner I claim.

At a very early day in my horse experience I was taught the importance of watching the strides closely, and before the days of instantaneous photography, had made many diagrams of the strides,

Digitized by Google

galloping and trotting. The footprints, at both gaits, were, of course, easily obtained, and the greatest error in which all shared, until taught by the camera, was that after the bound in the flying gallop the fore feet first came in contact with the ground, the last impulse to throw the body in its air flight from the posterior limbs. A quarter of a century ago I published in *Horse Portraiture:* "The footprints will show the manner in which a horse runs more clearly than they do in the fast trot. For instance, the 'tracks' are in this form when a horse runs:

* * * * * *
* * * * * *

"They vary more in the trot, some horses placing the hind foot more in advance of where the fore foot stood than others, thus:

* * * * *
fore hind fore hind fore

"The bound is very clearly shown in the shoe marks of the racehorse, though it is not so apparent in those of the trotter. That there is a time when the body is propelled through the air, is manifest from the strides that Jane made. The tape line showed nineteen feet; extend her feet as far as it is possible, and you will perceive that ten feet is beyond her capacity of reaching, so that the extra nine feet is made by the body being hurled along, before it is again supported by the feet touching the ground."

Is it at all surprising that I was "struck all in a heap" by the new "philosophy of the trotting stride," when after twenty-five years more study I had not discovered that I had so grossly erred? A momentous question, it is true, and one which will warrant discussion even when trotters and pacers are verging so nearly on the two-minute mark. And, now for the diagrams, a more eloquent peroration than words.

Elaine in harness—Stride 18 feet 3 inches.

* 4 feet. * 5 ft. 1½ in. * 4 feet. * 5 ft. 1½ in. *
Left hind.. Right fore.. Right hind.. Left fore.. Left hind..

Edgerton in harness—Stride 18 feet 3 inches.

* 3 ft. 7½ in. * 5 ft. 6 in. * 3 ft. 7½ in. * 5 ft. 6 in. *
Left hind.. Right fore.. Right hind.. Left fore.. Left hind..

Edgerton under saddle—Stride 17 feet 6 inches.

* 3 feet. * 5 ft. 9 in. * 3 feet. * 5 ft. 9 in. *
Left hind.. Right fore.. Right hind.. Left fore.. Left hind..

"When the hind and front feet land in the same place," were it possible outside of slow trotting—taking a part of Elaine's stride 13 feet 1½ inches, the foot marks would be:

* 4 feet. * 5 ft. 1½ in. * *
Left hind.. Right fore.. Right hind.. Left hind.. Left fore..

It will not be out of place to call attention to the variation from Edgerton in harness to Edgerton under the saddle. Did weight on the back increase the propelling power of the hind quarters so much that a stride which was shorter by nine inches, than that made in harness, cause the greater advance of the hind feet by seven and a half inches, shown by the shorter space between hind and fore, and the lengthening of the gap between fore and hind from five feet six inches to five feet nine inches? According to the old axiom "that an ounce on the heel is more than a pound on the back in racing," how should the weight be taken from the shoes to restore the equilibrium?

Puzzling conundrums, altogether too intricate for one of the warmest days I ever experienced in Oakland, and with the decided novelty of thunder and lightning. A poor display, however, when compared with eastern exhibitions of the kind.

OAKLAND, CAL., September 25, 1892.

JUDGING STANDARD-BRED HORSES IN SHOW RINGS.

IN company with another gentleman I lately judged a class of standard-bred animals at a western fair, and failed to suit a certain portion of the exhibitors because we declined to award the first premium to an unsound horse. The

Digitized by Google

stallion in question was a chestnut, of just fairly fashionable pedigree; his individuality was far from being the most desirable, and when stripped of his boots and weights would do nothing but pace if driven off a walk. He showed a fair amount of speed at that way of going, say a forty clip on a half-mile track, but his owner said that without these appliances he would not trot. Supplied with them, however, he had a mark of 2:23 and a fraction trotting. His front tendons were faulty in formation, badly swollen and showed plainly the marks of repeated blisterings; he was low at the shoulder, and rather longer in the back than is consistent with the greatest strength. No veterinary would have passed him as sound and not even the most prejudiced of his admirers could have pronounced him a beauty. Another of the defeated candidates was a long-legged, angular bay, of decidedly mediocre breeding, and incapable of a mile in 2:30 or anything like it, in fact an animal, which if gelded, would not have sold for a dollar over the 150 mark. It happened that these two horses were owned in the city where the show was held and the winning animals were not. The prize was given by the gentleman with whom I acted and myself to a bright bay stallion of Hambletonian descent, which, though not bred "in the purple" by any means, was a perfect beauty, and on further investigation we discovered that the animals we placed first and second had been awarded these positions twice before at the same fair with the most of the competing animals in the ring. This was, at least, some vindication of our judgment.

From these circumstances some right good lessons may be learned and some helpful deductions drawn. In the first place it should be an axiom never to award an unsound horse a prize in a show ring as long as there is a sound one to place ahead of him. Breeding to unsound stallions has wrought damage enough to the horse-breeding interests of all countries already without any further incentive being given to the perpetuation of this pernicious practice by awarding prizes to blemished animals. The public looks to the awarding of prizes in the show ring as an object lesson, and, if they see unsound horses receiving premiums over sound ones, they come to the conclusion that there is something wrong somewhere, either that the unsound ones are the best, and as such to be patronized, or that the judges do not know what they are about, and in each case the object of the show is defeated.

A horse with faulty formation of the fore legs will give way under training far sooner than one well built there, and it is therefore clearly the duty of a judge to discriminate against a horse, if not to discard him altogether from the prize list, when his damaged tendons show that from the start his legs have never been of the best.

Again, men who judge in the ring should not be governed by speed alone, or make speed paramount to all other conditions in making the award. Speed and proper action are two great points in the make-up of a horse; but when a fast record is coupled with inferior individuality or unsoundness, or both, the animal possessing it should not be awarded a premium over sound animals. Sunol is a very fast mare; but in the show yard with Lady de Jarnette, whom she can easily double distance in any race, it would be simply a farce to give her the premium over her more handsome rival; in fact no sane man would ever think of giving her the prize. Sunol, up until a short time ago, held the world's trotting record, is by the greatest of all sires of trotters, out of a mare in the great broodmare list, and yet as an individual she stands no show at all with Lady de Jarnette, who can not trot fast enough to keep Sunol's feet from getting cold, which is, however, no detraction from the magnificent excellence of the Lady. The place to measure speed is on the track, after the starter's bell has called up the contestants and the word has been given. Following this idea that speed and pedigree and not soundness and good conformation should govern awards in the show ring, we find that it tends to encourage the patronizing of speedy but unsound individuals, and the consequent production of inferior animals, which if they have not speed can not be expected to have good looks and

Digitized by Google

are, therefore, the most worthless brutes in the world, because very many small breeders are most apt to use the horse which wins first prize at a prominent show. If a man breeds trotters that can not trot, and which are not good looking enough to meet the demand for roadsters, he will very soon reach the poorhouse, and the sooner these speed-and-pedigree-only men find this fact out the sooner they will begin to climb the hill on whose top rests the temple of success. It would be folly to argue that speed is a worthless qualification of a standard-bred horse, but it is equally foolish to say that speed and pedigree should govern the awards, for a man could simply take down the books of record and decide such matters sitting in his office, without any show being held at all.

Talking with a prominent breeder the other day, I asked the question, "What will you have to take for your yearlings after a year or two?" He replied, "Three hundred dollars as they run on the farm, and from the superior beauty of my stallions it is more than probable that their colts are slightly in advance, for good looks, of those from almost any other large stud. I selected my stock horses with this end in view, and all of them, not excepting those with fast records, are absolutely sound." This value I judge to be very nearly a correct one, and if in a year or two $300 will be an average price for a lot of yearlings, which are bred for beauty as well as speed, and which as individuals consequently run better than most others, it is evident that the average prices of yearlings throughout the country will be less.

A perusal of the summaries of the races that have been trotted and paced at the prominent meetings in the Grand and Western Southern circuits this summer will show in a moment that it takes a horse with almost phenomenal speed to get any of the money at all, and what is more it takes one that can come and come again, for the contestants are, in many cases, so closely matched that the slightest mistake means the loss of the heat and possibly the race. Again, another glance at the summaries of the races which have taken place at many of the minor meetings, county fairs and the like, will show that to win even a two-hundred-dollar first money in some of the classes a horse must be able to go as fast as would have won almost any of the twenty classes down the Grand Circuit a few years ago.

But there is another side to the question, and that is, that in all the reports of the horse market we find that the demand for nice looking gentleman's drivers is far in excess of the supply. The other day I talked with a prominent horse dealer who operates chiefly in Iowa, and he remarked that it was hard to get good drivers nowadays and that he attributed their scarcity to the all-prevailing desire to breed speed at all costs, which has blinded the eyes of breeders in that state ever since Axtell made his wonderful record as a two-year old. This buyer went on to say that at one time in Iowa he could buy a good many right fine drivers of the Bashaw and other Iowa families, but that now every breeder was, with but very few exceptions, crazy to breed horses with speed at all costs. I asked him if he found plenty of light horses for sale, and he said that they were more plentiful now than at any time in his thirty years' of experience in buying, but that they were for the most part undersized and with some fault of conformation or action which rendered them totally unfit for his purpose, or, he added, for any other. This is a bad state of things, and from my own observation, is not confined to the Hawkeye state, but is general through the entire country. It is a matter of record that the country of the Morgans no longer produces the matchless drivers it was one time famous for, and this may be directly attributed to the fact that the Morgan mares have been mated with trotting stallions for so long that both the desirable disposition, conformation and endurance have been bred out of the kind. An understanding of the number of trotting-bred horses that are annually foaled and the number that annually enter the 2:30 list will prove beyond the possibility of a doubt that the vast majority of trotting-bred animals foaled never attain standard speed, and it is a question in my mind if the number that turn out really good gen-

Digitized by Google

tleman's drivers is as great as that of those which enter the thirty list.

These facts show that breeders of standard-bred horses must from this on breed for something besides speed—they must breed for size and quality as well. A horse with a goose rump and crooked hind legs may be able to go a fast mile but he will never look well before a natty buggy on the boulevard. Our great show horses, Mambrino King, King Rene and others, have proved to the public by their repeated victories in the show ring what class of animals is wanted for driving purposes, and while they differ in general contour and action they are both magnificent specimens of standard bred horses. Neither of them is gifted with great speed, the former being credited with trials at a twenty clip, and the latter has a record a fraction lower than 2:30. The fact that Mambrino King was in his prime universally conceded to be the handsomest horse in the world, and that King Rene never met defeat when shown with his colts, proves very conclusively that extreme speed is not necessary to show yard excellence, and it will also be found that the colts sired by both of these kings bring great prices and are handsome enough to step along in front of the nicest rig that Brewster can turn out. I have seen horses with fast records go down before them both, and deservedly so, in the show ring.

The whole matter, therefore, simmers down to the fact that breeders of light horses must aim to get in their young things good looks and soundness as the first requisites, and speed as the second. No argument that will hold water for a moment can be adduced to controvert this.

Another instance that cropped out at this show, where prejudice swayed a portion of the exhibitors, was in the aged-mare class. There were some five or six entries, one of which, a very sweet mare, of much quality, we placed first. Second to her in point of individual excellence were two mares very nearly or quite equal in point of merit, or rather from a general lack of it. One was possessed of the old-fashioned, goose-rumped formation one often sees in pacers bred in the bush, very straight in her pasterns and stood over a good deal on her knees. Her tendons were badly swollen and her hocks none of the best; her back was roached in quite a pronounced manner and her head was plain; her ribs were flat, and yet some of the disgruntled claimed that because she had a record of something like 2:23, she would have been awarded the prize over the absolutely sound mare we gave it to. The other was a large brown mare of better shape but moving a trifle off. There was an element of coarseness about her which put her out of court, in addition to the fact that she was moving a trifle lame. This mare had no record, but if she had been moving sound was entitled to the second place over the one who got it. The mare which we awarded first prize to is well bred, and though not very fast, is said by reliable parties to be able to trot in about 2:35. She was well made and perfectly sound, would have looked well on the boulevard, and would, if younger bring a profitable price as a roadster without such speed as she has, whereas the one placed second would not sell for anything over work-horse money bereft of her ability to trot below 3:00. The one bred to a handsome horse will, without any doubt, produce handsome colts, which if they can never beat three minutes or even four will bring to their breeder a paying price, whereas the other bred to the handsomest stallion on earth, will, on account of her bad conformation, ten chances to one, produce an inferior looking colt. It may also be mentioned, though this of course cut no figure in making the award, that the second mare has foaled several colts, none of which has shown speed enough to make their mother standard, and so the old mare had to quit her maternal duties and do the trick for the benefit of her progeny. This would show, that while they trot in all shapes, good-looking and well-built ones are more likely to produce fast and good ones than slab-sided, straight-pasterned, cow-hocked matrons. As Mr. Hamlin says: "The handsomest are the fastest."

An Illinois buyer with whom I talked, for I have made it a point to gain as much information as possible on this subject, said he could buy a car load of

Digitized by Google

three-minute geldings for me and put them in Chicago for $175 apiece, provided I was not particular about small blemishes or beauty. Then I asked him at what figure he would buy me a load of real "good-lookers" with the same amount of speed, and he replied from $250 to $300 each. These figures tell their own story pretty straight, and when they are studied it will be found that while a certain amount of speed is necessary in the good roadster it is not everything. For a dealer to practically retail a load of horses at $175, and, of course make his profit on them, pay transportation charges from the places where bought and other incidential expenses, it shows that the amount the breeder must get is comparatively small. After a study of this phase of the question it will be seen that three-minute speed is worth less than it seemed to be at first, so long as it is an animal's only claim for recognition. A three-minute horse is no longer of any practical use on the drives, and is of absolutely no use at all on the track, hence his usefulness is confined to a very limited sphere; but add to the three minute speed good looks and nice action at the trot, and the situation is at once changed, for while men may not care to go down the boulevard at a three-minute clip behind a beast with nothing but that clip to recommend him, they like to travel at that pace if they are conscious that the horse which is pulling them is looking well.

One thing more regarding this matter: no horse should be awarded a prize in a ring of standard breds as long as he is a natural pacer. At present in most show yards this distinction is not made, and judges are instructed to award the prizes irrespective of the gait at which the animals travel; giving, however, the preference in the event of equal individual excellence to a square trotter. The standard was formulated and adopted to encourage the breeding of *trotters* on an intelligent basis, not the breeding of *pacers*, and the short while that the mixed standard prevailed showed conclusively that the duplication of qualifications was not a good thing for the trotting-horse interest. Now that the standards have been separated, there should be two rings, one for the standard-bred trotters and one for the pacers, in order that proper encouragement may be given to such as are endeavoring to fix and establish a breed of pacers. It is a well-known fact that pacers will not sell for as much money as trotters, and it is also a well-known fact that a converted pacer, or a badly-mixed gaited horse will not last out his races nowadays with square and natural trotters.

Bearing these facts in mind it will be seen that speed alone is no criterion by which to judge a ring of standard-bred horses, and also that the pacing gait should be considered as detracting from the excellence of animals entered in standard-bred classes, admission to which is contingent upon the registration of the animals as standard-bred under the rules which were intended to form a basis for the establishment of a breed of *trotting horses*.

MAMBRINO PATCHEN.

BY CLARENCE BRYANT.

THE subject of this sketch was foaled thirty years ago (1862), and he died (in 1885) at the age of twenty-three years. The Register gives his pedigree as follows: Sired by Mambrino Chief, dam the dam of Lady Thorne, by Gano, son of American Eclipse; g d a bright sorrel mare with white legs and a natural pacer, by a son of a horse called Sir William; g g d a light bay mare that could go no other gait than a pace, blood unknown. He was black, stood sixteen hands high and had the best of legs and feet. One of the early numbers of the MONTHLY has a picture of him taken from an oil painting. It shows him to be a very handsome animal—of rather elegant appearance.

The war times in Kentucky were not propitious for Mambrino Patchen's early development, in fact he was never trained. but was thought to have considerable speed. His dam, as described by Dr. Herr, must have been a mare of high

Digitized by Google

lity. She was large, had good legs feet, was well proportioned, a fine elegant carriage with a great deal endurance. She had a number of ls.

Mambrino Patchen was brought into ice early in life by the performances is full sister, Lady Thorne, the great-race mare of her day, and afterward the sire of the winners of three-year-stakes in 1872, 1874 and 1875. In three-year-old stake of 1874 Lady ut made the best heat and race ever tted by a three-year-old, time 2:29. is was also faster than the four-year-record. Girl E. Queen and Lady tchen were considered extraordinary ies—the former in 1875 made the test fourth and fifth heats ever trotted a three-year old, except Lady Stout. It is now about twenty years since these nts occurred. Years of progress ely in everything,—and yet in nothing the improvement been more marked n in the breeding and development of trotting horse. Let us consider the rt that Mambrino Patchen has taken trotting affairs covering this period, re especially with reference to the Great Table" as contained in the Year ok.

Of performers with records of 2:30 or ter, he is the sire of twenty trotters, ssibly twenty-two), and one pacer, ur of these have records below 2:25, t the list is deficient when extreme eed is sought for and we look in vain even one great performer. One-third the total number have a single heat ly to their credit.

As a founder of a family we find that is the sire of thirty-seven sires. These ns have already nearly one hundred otters and pacers (over eighty trotters d eleven pacers) in the 2:30 list.

Of these sons we will make mention ly of Mambrino Boy. He is the sire Lou, the dam of Axtell and the sire of ussie Williams, the dam of Allerton, o of the most notable as well as the ost valuable horses that ever lived. lso dam of St. Vincent, 2:13½, and of ew York Central, 2:13½.

Axtell trotted against the three-year-d record (2:13¾) of Sunol at Terre aute in October, 1889. A mile was made in 2:12 without a skip, eclipsing all records for three-year-olds as well as the stallion record by 1¼ seconds. He was sold after this performance for $105-000, more money than was ever paid before for a horse.

Allerton is a bay horse about sixteen hands high and was foaled in 1886. As a two-year-old (1888) he obtained a record of 2:40¾. In 1889 he reduced his record to 2:18¼, winning four hard races. He started as a four-year-old (1890) in four races, losing two and winning two, reducing his record to 2:13½. In 1891 he trotted against time as follows: July 4, in 2:13; September 4, 2:10; September 9, 2:10; September 12, 2:10½; September 14, 2:11; September 19, 2:09¼; September 21, 2:09¼; September 25, 2:09½ and on the same day made a wagon record of 2:15. He trotted a losing race on August 24 against Nancy Hanks and Margaret S. The time of the three heats was 2:12, 2:12¾ and 2:12. In these two horses, Mr. C. W. Williams has the distinction of breeding and owning the two most valuable horses ever owned by one man.

Mambrino Patchen is the sire of fifty-three dams which have produced fifty-seven trotters and six pacers, the list includes seven of the great broodmares. Comment is entirely unnecessary in connection with such a showing as this. We spoke particularly of one of the sons, Mambrino Boy, and now in connection with this list of dams we would call attention to a daughter, the great mare Alma Mater as the mother of the brothers Alcyone and Alcantara.

Alcyone was foaled in 1877 and bought at eight years of age for $20,-000 by Mr. Elizur Smith, of Lee, Mass. At the National Horse Show in New York city in 1885 he was awarded the first prize in his class, beating Mambrino King. He is the sire of twenty-five trotters (and two pacers), whose average race record is 2:21½. Of these Martha Wilkes, 2:08; McKinney, 2:12½, and Alcryon, 2:15, form a great trio. To extend the list further the black mare Bush has now a race record of 2:14½; Alcyone Jr., 2:18¾; Ramona, 2:19¼; Harrietta, 2:18¾; Silverone, 2:19¾; Golden Rod, 2:19¼; Iona, 2:17½,

Digitized by Google

and the pacer Alcyo, 2:18¾, and it is expected that before the season is over two, possibly three others will trot below 2:20. Martha Wilkes trotted three heats at Independence, Iowa, recently in 2:12, 2:10 and 2:09½, the fastest three heats ever made in a race. All of this, it must not be forgotten, has been accomplished by a horse who lived but ten years. It is only when we consider his short life that we are able to measure his success as a sire and we are led to wonder what the result would have been had he lived as did the "Hero of Chester" till "well stricken in years."

Alcantara is a year older, and as a race horse proved himself one of the very best. He made his first appearance on the turf as a four-year-old, making a record of 2:23, the fastest ever made at that time by a four-year-old, and out of eight races in which he started he won six. He is the sire of thirty-six trotters and fourteen pacers in 2:30. Of these the pacer Allen Lowe has made a record of 2:16½ and shown himself to be one of the best horses of this season, and Chronos paced the third heat of a race in 2:12½ at the recent Mystic Park meeting.

A great deal has been said of the Wilkes-Mambrino Patchen combination as uniformly producing speed, and in looking into the matter we find that this blood does "nick" remarkably well. Out of dams by Mambrino Patchen nearly one-half of the entire list has this cross. As imperfectly as the achievements of this family have been presented in this paper, the facts as given show that it has taken an active part in trotting events during all these past years and that to-day some representative of the family is looking after a part of the purse in every great race meeting over all the country. In the light of such a fruitful past it requires no prophet to foretell the future. Mambrino Patchen, in the long list of splendid sons and daughters, has left a rich inheritance. It would be hard to find a more worthy representation or one better fitted to wear the mantle of their illustrious sire.

A MELANGE.

BY H. B.

A merciful man unto his beast is kind,
But brutal actions show a brutal mind.

"MAN'S inhumanity to man" is a common cry. *Man's brutality to brutes* might be as truthful a saying as the former if we would only fully admit it—at least among certain kinds of "men." We are not, however, prepared to admit the entire force of the latter, for in the breeding world we have often been impressed with the fact that it is even possible for some to regard the life of a promising colt or calf as of more consequence than that of one of the owner's hopefuls. Indeed, it is an old proverb in Galloway that "A good farmer would rather kill his son than a colt."

Improved stock is certainly nowadays too valuable to be the object of the perpetration of human brutality. Still in how many cases are we not wofully forgetful or blind to many a trifle that might ease the routine of toil, or improve the condition of our faithful four-footed helper. A story is told of the Ettrick shepherd that one day one of his hired loons (boys) came to him in his study and told him one of his mares was sick and "hadn't he better come and attend to her?" He looked up from his manuscript and replied: "Na, nae th' noo. I've got to gang up the hill and kill a baad (hare) for denner." On returning home the mare was dead. In killing the hare he had killed the mare.

Every summer during these inevitable hot spells our horses suffer more than ourselves from the heat and flies, simply because we have so little studied proper means for alleviating their distress. They often drop dead in the streets.

In hot countries some provision is made for protection. In Bombay and Calcutta, which contain a large number of Turkoman horses and Australian *walers*, used in the tram cars, these animals are provided with sun bonnets or pith helmets as a protection from the

Digitized by Google

sun. These horses are among the few in the world that have such head gear. It prevents sunstroke and headache, to which animals from cooler climates are liable on introduction to a warmer. These helmets are excellent things.

In Australia the horses are rigged out with a light covering, arranged about six inches from the body and neck. This allows, induces, a constant circulation over the animal. It is also useful in keeping off flies. Besides, it absorbs a portion of the direct sun's heat.

At Long Branch, N. J., may be seen a pet donkey, after his daily burden has been disposed of, dressed in a protective garb—overcoat and pants—gathering his sustenance in the field, proof against the penetration of the Jersey mosquito. "If by chance a winged pest gets up a trouser leg a stamp or two of the sharp hoof dislodges it." Tail and ears can take care of themselves. The suit is composed of muslin. Some equine neighbor of this well-cared-for individual might, if he was a talking horse, exclaim: "Oh that I were writ down an ass."

The terrible pest of summer flies has not yet been overcome. One more specific is to rub the body all over with a cake of carbolic soap—dry, not wet. The better the horse has been previously groomed the more of the acid extract it will absorb.

Sponges on the heads of horses are all very excellent if they are kept moist. Constant rinsing of the mouth in summer is also a thoughtful humanity. The little parasols sometimes seen on the heads of horses might suggest a "long-felt want" for some manufacturing caterer to supply.

In Persia the horses are covered nightly with what is called a *nummud* from ears to tail, bound firmly round the body by a very long surcingle. This clothing is only used in cold weather. In warm weather the night clothes are of a simpler description. The loin cloth—water-proof—for wet weather, and the breast protector for winter are humane materializations. It should be remembered that the horse in civilization has to constantly face inclemencies of weather that in his free state he would not. It therefore behooves man to give him protection as he has to give himself. Besides it will profit him to do so.

Perhaps the most fashionable pieces of harness, after the bearing rein, are the blinkers. These, however useless, are "vestiges"—evidences of a former incomplete mastery of the horse by man. But they remain, as they are just the thing for the fashion-plate eye. The flashing enamel of the leather is a convenient spot upon which to fix a silver monogram or crest, to denote, with the animated livery on the box, the owner's pretentions to "Norman blood." Now we would suggest an innovation in blinkers or blinders. Why not make them transparent of crystal framed in silver? The crest or monogram could remain while the horse might see.

Humanity ought to begin at home. So the stable has always exercised the minds of hygienists. Mr. J. Malcolm Forbes, the owner of the highest-priced and the fastest-timed equines, has original views on stables. Simplicity of construction, cleanliness, plenty of light and air, protection from sudden changes in weather and bare ground to stand on are, he believes, the chief requisites for the successful breeding of race horses. His stables are constructed on that plan. "I am," he says, "a firm believer in the intelligence of horses. If a horse is properly handled I believe he can be made to understand and obey any commands within the bounds of reason. Sight is one of the greatest gifts in the education of horses. He wants to see what is going on. For that reason I have constructed my stables so that each stall has a large window so low that my horses can stretch their necks outside and get plenty of fresh air and sunshine. At night and in stormy weather these windows are closed, but each is provided with a good-sized ventilator, which keeps the air circulating without throwing a draught upon the horses. But the most important feature of my stalls is their foundation. My horses stand on loam; they eat it, they sleep on it. Mother Earth is the best specific for a horse that I know of. Give a horse plenty of air and light, plenty of exercise, plenty of the right kind of food and plenty of clean loam to eat and he will always be in good

Digitized by Google

condition. That is the secret of the success of Kentucky-bred horses. The blue grass region is famous for its horses, but I firmly believe that it is the good Kentucky dirt, and not the grass, that is the secret of their success in horse raising. There are not many who realize how much dirt a horse eats in the course of a day. Why it is not at all an uncommon thing for a horse to eat a good-sized capful of earth in a single day. He needs it to stimulate his digestive organs just as much as a fowl needs gravel. Keep a horse away from dirt, shut him up in a stall with board foundations, and he will quickly get out of condition. My stalls were constructed with this idea. For the foundation I have a thick layer of gravel, and over that I place several inches of clean, rich loam. That is all, except occasionally a layer of straw, in extremely cold weather, may be added. The gravel serves as a drain for all impurities and the loam is changed as often as the occasion seems to demand. As soon as it loses its freshness it is removed and a new layer is spread. As a result of this system, my stalls are kept absolutely clean and sweet without the use or need of any disinfectants. There are no unnecessary ornamentations. Such things collect, harbor the dust, and keep the air full of impurities. For that reason I have constructed my stables as simply as possible."

It is a fact that horses in drinking, when at freedom, will soil the water with their feet so as to obtain a drink to their natural craving.

The question of the amount of air space needful for horse stables has recently been under consideration by various sanitary authorities. Horses, it is said, require double the space—400 cubic feet—allowed to man. But even 800 cubic feet "packs horses too closely." No horse owner should be satisfied with less than 1,200 feet. With less space it is scarcely possible in winter to keep a stable at a temperature of from 60 to 64 degrees Fahrenheit, and have the air free from noxious impurities. An overcrowded stable can hardly be kept pure and healthy without draught. The close, vitiated atmosphere in which many hard-worked horses spend considerably more than half their lives is the chief cause of lowered vitality, of lung and bronchial troubles and other kinds of sickness.

The celebrated Col. John Thomas North is as famous for his love of horseflesh as he is in the business character of "the nitrate king." He is a familiar figure at all the more important race meetings in England. His stables at Avery Hill, near Eltham, Kent, for the carriage and saddle horses are more sumptuous, perhaps, than those for his breeding horses. Big box-stalls in hardwood, with iron rails, floors of cement and walls lined with encaustic tiles give a neat appearance of spic-and-span correctness that is pleasing to the visitors' eyes. One room forms a Turkish bath for the horses. A coil of pipes run around it and steam can be turned into the room from these. When a horse has caught a cold, or is a bit off, or stiff, and thereby needs therapeutical treatment, he is, by preference, turned into this apartment and the ache is "steamed out of him" with hot vapor.

At the famous Souther ranch near San Leandro, Cal., has been constructed and equipped a tank for swimming horses, the first of its kind ever built for the use of a training farm. "It is built of concrete, and is about eight feet deep. thirty feet wide and ninety feet long. There are suitable pipes for filling and emptying it, and facilities for warming the water. The horse is taken in and out from a platform on one side. Salt water is frequently introduced." The bath acts as a tonic to the jaded animals.

In swimming the horse makes as much or even more violent exertion than he would on a race track. As there is no concussion or impaction there can be no injury to the feet or limbs. "Frequently famous horses have been taken lame during the season, so lame that they had to be given complete rest to prevent permanent injury if continued at exercise on the track. It was generally regarded that when these horses went lame their season of usefulness was over. Two or three weeks of idleness of the muscular organs, that would have otherwise been in continued training, but for the neces

sarily imposed rest of the weak member, generally unfitted them for future work or catching up to their former speed. It was quite a surprise for the talent, therefore, when such horses turned up a few weeks later, apparently as fit as ever. The swimming baths, however, soon gave an explanation of the 'mystery.' The horses being made to swim every day, thus got all the exercise they normally required for keeping them up to their standard 'form,' at the same time relieving the hoofs of the hard pounding of the track, thereby preventing the aggravation, and soon relieving and therefore curing the injury sustained." The philosophy of the tank is no less striking than its humanity.

One of the most conclusive proofs of its benefits is said to be the case of Allerton, whose record of 2:09¼ is attributed to the particular virtues of the bath. It is said the horses "swim in all gaits."

Horses frequently feed too greedily; to prevent this it has been found useful to place some large pebbles or marbles in the oats. A change of diet is always a good thing to bear in mind. Training to eat sweets, bread or fruit leads to a better understanding between horse and man. Attention to the wants and tastes of the inner horse is no less effective than in regard to man. Astley, the great circus manager, found that the best way to tame and subdue wild or vicious equines was to carefully refrain from feeding—that is to starve them into docility—to instil a feeling of dependence in them.

San Francisco's S. P. C. A. owns an ambulance—the only one in the entire town—and it is used, not for human, but for horse maimed. This fact goes a good way in demonstrating the truth herein expressed that horseflesh is held in higher esteem than the human equivalent. The ambulance, an immense affair with gold emblazonry, is always ready on call. It is put to frequent and excellent use.

If such an ambulance does not exist in Chicago, one or more should be immediately provided. We say this because we have one of the best veterinary hospitals in the world—under the auspices of the Chicago Veterinary college. We would suggest to this institution the obtaining a hospital ambulance.

It was a student indeed of this excellently "chaired" institution, we understand, who invented that great modern aid to equine surgery—the tilting operating table. Any one who appreciates the dangers of "casting a horse" in order to operate on him, knows the constant source of anxiety the surgeon always labors under in this preliminary operation. Indeed, many a horse's back has been thus broken. The tilting table does entirely away with all this danger and anxiety. The horse is led close up to the table as to a wall. His body and legs are strapped to it, a crank is turned, and he is lying on his side on a flat table! This idea must have been taken from the old-fashioned round table tilted up in the corner of old country "dining-rooms." It shows how long an idea is in being adapted and how few are smart enough to catch on to what is being presented to the eye every day.

The suspensory sling is another aid that has long been taken advantage of by veterinarians.

As to the use of anæsthetics in veterinary practice (the first notice of the use of which we know of occurred in the year 1848) there seems to be a difference of opinion. Dr. Hughes, the skillful surgeon of our Chicago college, declares that he prefers to operate without using any. "You know exactly the state of your patient without using them, while you are always more or less in the dark using them." For the ultimate benefit of the patient, except in "local" instances, their use is not advocated in Chicago practice. With the tilting table, giving more complete control over the position of the body, etc., there is not such a call for the use of anæsthetics.

Wonderful progress has been made in veterinary medicine and surgery lately. Horse dentistry is now an important department. In fact the science ranks with human medicine and surgery. Once we ventured a remark to a celebrated veterinarian in Britain as to the difficulty of diagnosing a disease in animals unable to tell the physician his symptomatic feelings. "There you make a mistake," he quickly retorted, "such speaking

Digitized by Google

patients always tell less or tell more, conceal or exaggerate. They are not to be trusted. We can trust our patients every time. No unreal feints or plaints among the dumb animals. You see where we have the advantage?"

A mesmerist in London by the name of Peyrani, has succeeded in mesmerizing the horse. The horse is, in the first instance, placed in a sitting posture on a "chair" at an angle of forty-five degrees. Peyrani proceeds for some few minutes with mysterious manipulation over the equine subject's head, eye-balls, neck, haunches, and back. The animal gradually slides from an upright position, and falling sideways on the stage flooring, remains at first immovable and seemingly helpless. By and by he is rolled over on his back, and the professor causes him to place both his fore and hind legs unsupported in a perpendicular position, to bring the former, without any joint bending, into immediate contiguity with the latter, and to do various other movements which one is accustomed to witness at mesmeric *seances*, where patients, either the male or female sex, are performed upon. Many of the horse's actions are identical with what the circus arena has made us familiar. Ducrow, Astley, Cook, Sanger and other experts showed to what perfection intelligent horses could be brought, but Peyrani's mesmerized pupil leaves them far and away behind.

Vaccination has been found to be beneficial to horses having the glanders. This treatment is now in vogue in France and Germany. Experiments have been carried out by the German departmental veterinary surgeons, Peters and Felisch, with the mallein, or glanders lymph of Preusse. Both these experimentalists are of the opinion that when horses affected with glanders are vaccinated it causes a reaction and rising temperature, which as a rule, would not take place in a healthy animal. Out of ten horses vaccinated and showing these symptoms only one was found to be free from the disease. It may be detected within ten hours from the time of vaccination.

Reports of the success of artificial impregnation of mares have recently been appearing. The Lima Stock Farm, Ohio, has succeeded in getting three valuable mares in foal by the process. Miller and Sibley have, it is reported, also been successful in securing the impregnation of a mare by the same process. The plan has been outlined in a report from a Saginaw authority. He attests to the success of the operation in so far as getting the mares in foal is concerned. A filly was foaled May 10, 1892. Its dam was bred two or three times but proved barren. Last summer as an experiment, artificial impregnation was tried. The name of the mare is Mollie K. A mare was bred to Sphinx and when the service was completed the semen was caught in a glass. After cleaning the vagina, the glass in the meantime having been put in a pail of water warmed to the proper temperature, Mollie K. was brought up and the semen injected. She proved in foal from the semen so injected, the result being a fine bay filly with black points, very strong and smart. Up to date four mares have been bred artificially. Three are safely in foal.

The result of an experiment performed in the Bay District, California, track March 22, 1891, to imported stallion Suwarrow was that Sister Ruth Ryan foaled February 19 last, a perfectly formed, well developed filly. She was foaled three days before an eleven months' term of pregnancy.

These experiments may lead to important innovations in the system of breeding.

A contemporary says: Quite a new thing is to be tried. A very fast yearling by Bow Bells is nearly blind caused by a bad case of distemper. The veterinarian in charge is working on the colt's eyes and will soon fit the youngster out with a pair of glasses. The colt is in training and is very fast. He goes on a square gait, but every now and then imagines he sees something in his way and will come to a dead halt. It is hoped that the glasses may set him right. The idea is certainly a novel one.

The *Optician*, published in London, England, confirms the story that a well-known firm of opticians in that city manufactures specially constructed spectacles to be worn by horses. The object

Digitized by Google

is to promote "high stepping." Horse spectacles, it is said, are made of stiff leather, quite enclosing the eyes of the horse, and the glasses employed are deep concave and large in size. The effect is to give the ground in front of the horse the appearance of being raised, the animal therefore steps high, thinking he is going up hill, or has to step over an obstacle in front of him. If the system is persevered with when the animal is young the effect is said to be marvelous. Many horses, it is alleged, could be materially improved by a visit to the optician, and it is recommended that the sight of all horses should be tested. This particularly applies to valuable hunters, which are sometimes found optically unfit for their work, when a little artificial assistance would make them as useful as ever. Apart from this, it is believed many vices might be cured by means of eye-glasses. The cause of shying is as a rule short sight.

It has been reported that spectacles have been used on trotters, supposed to be useful at the finish—to make the horse "spurt" at the end of the race, the spectacles bringing the wire or end nearer to the horse so that he will "answer to the call" the sooner and thus the extra burst of speed can be more fully utilized.

We may mention in passing that Moravian cattle owners have supplied their cattle with blue eye-glasses to prevent snow-blindness. So that we should not be prevented, by apparent novelty, from trying all means of alleviation.

Washing horses is a practice to be condemned unless the horse is afterward thoroughly dried. Great care and attention is necessary, and not taken trouble will follow. The use of the sponge to remove surface superfluities is about as far washing should go. A wisp of clean straw or hay used to promote circulation, a blanket thrown over to absorb moisture, and gentle exercise till dry, followed by a rest and a bite, are all simply traditions of the stable.

To absorb the sweat under the saddle, pads composed of sheepskin, leather, or india-rubber are in use in some places. The hair under the saddle is left unclipped on hunters. Saddles should not be removed immediately the horse returns to the stable. The girths may be slackened.

A good sweating is often a good preliminary to a thorough, initial grooming. It loosens the dirt! But it should not be made a practice. If too frequent and profuse it softens the skin, thus permitting the entrance of cold.

Another aid is the dietary one. "Good grooming commences with a good lining to the inside." Good feeding induces the secretion of the oleaginous matter that gives that shiny gloss so dear to all lovers of horse quality. Elbow grease applied *ad libitum*, also is an indispensable recipe for following the same.

Care of the horse after a race is as essential as before. It takes as much skill and horse sense to bring back a horse to his normal stable leisure, as it does in preparing him for the track. It is a poor way to take care of a horse after one race for the stable rubber to "sit on the fence watching the next."

Youatt mentions a case of a hunter dead beat, apparently dying, being revived and recovered by his owner pouring down the horse's throat his flask full of sherry meant for himself.

Though bathing horses is doubtless a first-rate thing, especially if in salt water, washing to clear them of dirt was an early inculcation as being wrong. The only way to clean a horse it was insisted was drying, rubbing and brushing. "Especially keep from washing the legs." Mud fever is the result of stable indolence. The first advice in such a case is: Cease washing; bandage the legs and rub off the dirt in the morning.

A bandage, in which pipe-clay forms a conspicuous part is with some a favorite application to the limbs of any racer that may get stiff. The clay absorbs the over-heat.

Clay and "dirty" cow-dung formed into a compost is also a first-rate packing at night for the feet, keeping them cool and soft.

The importance of feeding horses at short intervals has been insisted on by the highest authorities. Fasts of six, eight or more hours are very prejudicial and sources of gastro-intestinal derangements, impairing condition and strength.

Digitized by Google

Nose-bags should, therefore, be a permanent essential of vehicular outfits. Great care should be taken to see that the fodder and grain are in good condition, free from dust or mold. If not, intestinal and sometimes urinary calculi, diabetes, etc., result.

A sufficiency of "pure water" is essential for the health of horses. This necessity has induced many owners to place a tank, automatically supplied, in every stall or box. The proper time for a horse to drink is when he feels like it. Unless the horse is overheated or exhausted a reasonable quantity of water will do him no harm. Water should be within reach when the horse is eating his dry food. The danger to prevent is the taking too large draughts immediately before or after eating or working. Water, ice-cold, is, of course, a bad thing in winter. The temperature may be raised by injecting jets of steam into the water-troughs or tanks; a drink of water with the chill well off, but not "warm," and meal and a pinch of salt mixed in, is a treat to a horse when he is fagged.

Early in the world's history it is known that the hoofs of horses were protected by boots of leather. This must have been at a period antedating Pliny and Aristotle, both of whom mention the protection. These leathern boots were occasionally studded with metal nails. More usually they were worn without extra trimming, the cheapness of leather making rebooting of easy accomplishment at any time. Homer speaks of "brazen-footed" steeds, from which allusion we may naturally infer that in his day the horses of the Greeks were shod with bronze or brass. We are reputably informed by two Latin writers that the mules of the fiddling Nero were shod with shoes of silver, while those of Poppæa, his wife, were shod with gold. These shoes were in the form of plates, but they were fixed with nails. In Rome, indeed, shoeing was known in the time of Cæsar.

Horseshoes have been found at Towmey, in the tomb of Childeric, the Frankish king, which refer us to the date of 480 A. D. Iron shoes were nailed to the hoofs of war horses in the ninth century. They appear to have been introduced, also, into comparative general use in England by William the Conqueror in the latter part of the eleventh century.

At the present day the Japanese use horseshoes made of braided straw. They have to be often renewed. Compressed rawhide is used in several European countries to-day for the same purpose. Among the Kirgis the horses are also, even to-day, shod with pieces of deer's horns. In Iceland, for the same purpose, sheep's horns are used; these are fixed by the peasants themselves and not by regular farriers.

In southern Asia, where the greater portion of the surface of the earth consists of sandy plain and dry desert, the hoofs are hard, and, therefore, are not shod. Hence the invention of the shoe can not be traced to either Arab or Persian nations.

The ancient term for the shoers of horses was *farrier*. This word is derived as every one knows from the Latin *ferrum*, meaning iron. The farriers were "shoers in iron." When the term was first applied, it was a title of the highest distinction. Very few had the skill necessary to be an accomplished farrier. It was a valuable gift, especially when the horse was such an invaluable, necessary adjunct of war. In those early days, indeed, the gift was confined in certain families. They were royal favorites. The noble earls of Ferrier or Ferrers had such an origin.

Now "ferriers," as the word is still spelled and pronounced in Scotland, are not of such high degree. It is a word to use which is quite derogatory to the qualified veterinarian of to-day. Indeed, as the distinguished Dr. George Fleming once remarked, at a professional function presided over by the Prince of Wales, the profession had lost its caste, so that with the degeneration of the ancient order of ferriers, they had no claim or recognized right to be included in a gathering of gentlemen! Thus the growth of a new system had left them in that predicament. He brought this before his highness, with whom the prerogative of rectification of this ostracism from the society of gentlemen reposed. The prince at once proclaimed himself proud to be surrounded with the *gentle-*

Digitized by Google

men before him, which title, he assured them, would never be denied the profession in the future.

It was in 1751 that Jeremiah Bridges formulated the since-famed phrase: "No foot, no horse." He pointed out that horses bred in Derby, or in the mountains of England, Wales and Scotland, had good feet, while those bred in the fens of Lincolnshire had commonly flat and soft feet, due to the moist soil, which relaxes their texture. White feet, he asserted also, were less durable than black feet.

"What is the use of having a team shod if they will work as well not shod?" asks a writer. "Nature will care for the hoofs nine cases out of ten, so that the growth will always equal the wear, and a tough, springy hoof, will grow where a hard, brittle one was. I had a road mare that interfered badly, and no shoeing or use of boots could keep her from being lame half the time. I took her shoes off, rasped down the edges of her hoofs and drove her as freely as before. In three months she moved without a limp, her hoofs were sound and free from chipping and seem to have *worn to suit her way of going.* I used her almost every day on all sorts of roads for two winters and one summer, in dust, ice, snow and frozen mud, in the country and on city pavements. She traveled as well and freely as any horse, and did not interfere. Her hoofs stood the wear perfectly. While on ice she traveled as well as a sharply-shod horse." A wonderful mare certainly. Such as she turns up every once in a while. But why can't we raise such a really brazen or flinty-hoofed race of horses fit in their "feet" for the hard pounding of modern streets and speed?

Training or shaping of the hoof from an early stage is advisable, keeping the hoofs even in growth by paring where necessary may prevent abnormalities from arising. Unequal wear is prevented by this early examination and attention. Horn—as the nature of the all hoof is—is a pliable structure, which may be successfully treated in this way.

In the East Indies, where pony racing is very popular and profitable to the winner—the standard height being under 13.2—many expedients are resorted to "smuggle through" a pony that stands naturally over that mark. One of these expedients is the cutting or paring down the feet as far as can be done with impunity. It is stated that those ponies which were most frequently up for measurement were the handsome little Arabs and Australian "walers." These had their hoofs generally closely pared down, but it was done by an artist. These were the ones "whose feet subsequently stood best the trying ordeal of training and racing on the adamantine going of the tropics." Of course these ponies, reared where they had been, developed good hard feet.

In the *Popular Science Monthly* for February, 1884, Arthur F. Astley writing on the "Working Capacity of Unshod Horses," made this statement: "In New Mexico, horses are ridden barefoot forty miles day after day, and perhaps twenty miles of this will be over twenty miles of mountain track." Lieut. Theodore Smith, of the U. S. A., sent a communication to the same magazine in which he said: "I have served with my regiment in New Mexico for several years, having large number of both horses and mules under my charge. While it is true that most horses are ridden unshod by the natives in the valleys, where the roads are sandy and soft, it should be borne in mind that even there the majority do so simply because they are too poor to have their horses shod. But when it comes to traveling over rough mountain tracks the writer's statement is simply absurd. The Indians (Apaches) understand the inability of unshod horses to travel over mountain trails so well, and they cover their horses' feet over with rawhide bags, and, when the latter wear out, the horses soon become disabled, and I have frequently found Indian horses abandoned on the trail, with their hoofs bleeding and worn, and the poor animals in a most pitiful plight. Again when Indians are enlisted as scouts, they furnish their own mount, and when reaching the post, request to have their horses shod."

An important progressive step is, says *Iron*, about to be realized in the art of farriery. The Compagnie des Tramways de Paris has recently tested a horseshoe

Digitized by Google

made of Bessemer steel, which is fastened on the hoof cold, in a few minutes, without the employment of a single nail. The shoe is similar to the ordinary iron kind; but it possesses in front a bent lever, which attaches itself half-way up the hinder wall of the hoof, without in any way compressing it. A clamp, also of Bessemer steel, then encloses the hoof, parting the two heels of the shoe, and supports itself on the top of the lever, which wholly sustains it and prevents it, in consequence, from compressing any portion of the wall of the hoof. The shoe is fitted with three small interior clamps, which penetrate the horn of the hoof and prevent displacement of the shoe without the preliminary raising of the clamp. In addition to the horses of the Compagnie des Tramways, which, furnished with these shoes, do their twenty-one kilometres—thirteen miles—per day, several private Parisian firms have experimented with the new shoes, with, it is said, perfect success. The latest form of horse-shoe will, it is considered by many in the French metropolis, sooner or later revolutionize the farrier's industry. The railway van horses are to be supplied with the new shoe.

In Berlin, the smith, when finishing a shoe, punches a hole in the two ends, and when the shoe is cold he taps in a screw thread and screws into the shoe when on the horse's foot, a sharp-pointed stud of an inch in length. Thus fitted horses can travel securely over the worst possible road and not slip. This is, however, a by no means new or novel practice.

We may possibly some time arrive at a "newer and better" way of shoeing than is practiced to-day, though most all of the new methods and innovations break down. They don't stand the practical test of even short experience. The form of the present shoe as made and fixed by our most intelligent smiths is the result of the "accumulated experience of centuries." Even the wedge-shape of the heads of the nails is the result of the same experience.

If we felt like horses, we would likely appeal from bare-feet and nailless shoes, and wend our way meditatively to the forge predominated over by brains, such as we have evidenced in the head of the truly humane S. T. H.

What has become of the shoe that was invented recently in London to be set in the recess of a metal frame? It was to be especially adapted to cities where there are asphaltum, wooden or other smooth pavements, for it is impossible for the horse to slip.

Referring to asphalt and wooden paving it has been found by experience in London, where streets are not all level, and where there is a deal of wet weather that many accidents occur from the horses slipping. The "dampness" induces the formation of a muddy "grease" that provokes slipping.

Concerning the merits of aluminum shoes for horses, a blacksmith of Cleveland is quoted as saying: "I have found time to experiment with aluminum, and have succeeded in making shoes which stand the wear and tear of the local gravel and cinder drives. I shod a 1,250 horse, and after three weeks' wear, the shoes show no more wear than would steel shoes on the same horse. I am satisfied I have succeeded in making a shoe that combines strength, solidity, stiffness and lightness. It is found that a two-ounce plate is of the same size as a nine-ounce steel shoe.

Electricity has recently been applied to establish, after shoeing, the state of a horse's foot. One pole of a battery is put in contact with the inside of the hoof, the other pole with the iron shoe. If the hoof has been pierced with a nail to the quick, the horse will feel the electric current and exhibit consequent irritation. Otherwise the current can not pass through the foot.

It would be a good thing if, as in some countries, a heavy penalty were attached to pricking by careless horse shoers.

If the shoe can not be further improved the next best thing seemingly to do is to improve "the going" for the horse. A street in Berlin has been paved with india-rubber, with satisfactory results. It is said to be more durable and less slippery than those commonly in vogue.

In London a new paving has been introduced. It is composed of granulated cork and bitumen pressed into blocks. These are laid like bricks. The material

Digitized by Google

renders this paving very elastic. This paving is as yet only used for sidewalks. It gives a sensation as if treading on carpets.

More could, also, surely, be done with our tracks. Perhaps the time is not so far distant when covering the entire track will be a *sine qua non*, simply for the purpose of keeping it in proper condition.

In building if they were constructed after the manner of a properly macadamized road we might the more speedily see that the advent of that 2:00 mark. A foundation of this nature suitably superimposed, with side ditching, though it would all be costly, would make an ideal track. For instance if the interior of the Washington Park track had been beautified with an "artificial lake," we would not have seen the carriages splashing and plunging through axle and knee deep water. It could have defied Jupiter Pluvius!

The Old Orchard track in Maine has side ditches. The water can be controlled "at any height." Sea water is used to sprinkle the track. "The constant evaporation will leave a coating of salt, which will keep improving the firmness and speed of the road-bed."

THE WORTH OF SYSTEM.

BY RAY MARSHALL.

There is a right way of doing most things. The majority of people, however, often engage in an undertaking in the wrong way. Some of the best meaning people, too, and the best of people they are, usually, are noted particularly for the unfortunate faculty of doing everything in the hardest way. Such persons seem to be so constituted in their way of seeing things that the right method never secures their attention. On a stock farm or about the stables such people are too often found. It is not confined, either to the stable boys proper, nor to the manager, but even the proprietor is sometimes afflicted with unfortunate constitution of mental parts.

In no one respect do such proprietors blunder so much as in the construction of their buildings, wells, cisterns and adjoining yards and appurtenances. With a view to safety and with this one idea uppermost in mind, such men often have their barns constructed with numerous box stalls, each separate and opening on the outside, and to make things still more inconvenient to guard against fire, etc., a granary with feed is located some distance from this building with perhaps another structure for hay in still another direction, and some distance away from either building. It thus happens that when the feeding is to be done two or three times a day, the boy doing the work must open and close a door at least twice at each stall, and while inside is exposed to danger of being hurt by the animal. It may be said in reference to this matter, that a horse of the best intentions may in play hurt a man who is intent on his work, and giving his attention to the door and feeding basket at the same time. So that while it may be said that with the right sort of horses one is seldom in any danger of damage in any way, there is really more occasion for concern on account of the animal's playful disposition or a case of its mistaken identity in viewing the feeder. In constructing such buildings it is often thought that a wise economy is practiced in making the structure narrow, without a long hall or feedway between the stalls. And it is thought that with this amount of space saved, as well as the additional partition required, that on the whole the inconvenience of carrying provender to each separate stall by an outside opening, or the other plan which occasions great waste of room on the upper floor, where hay is stored in the second story, is fully met. On too many large farms, too, and about many of the extensive stables, the facilities for watering the stock are seriously inadequate. Too often there is neglect to supply a hose by which water can be conveyed some distance from the well by the action of the pump. In the

Digitized by Google

case, too, of cleansing the vehicles used by the establishment, the most difficult and tedious plan of washing with a sponge and pail of water is too often the rule, when a few dollars' expense would provide a tower tank whose elevation would give force enough to the water so that three-fourths of the time occupied in the crude way of cleaning both horses and wagons would be saved. Such items, and numerous others too tedious to mention, are, however, of minor importance compared with the value of such water facilities in the emergencies of incipient fires. In the case of the very deep tubular wells that are but a few inches in circumference and extending deep into mother earth, requiring of necessity a power pump, a tank of sufficient magnitude and height is too often neglected, in which an advance supply of water might be kept for an emergency, in which the machinery of the pump or power might be damaged, occasioning days, and at times weeks of delay in their repair. It is at such times when it may be necessary to take the stock to a distant part of the farm, to a remote stream or the neighbor's well that the business man who is quick to see a point observes that he might have anticipated all of this loss of time by employing the foresight which a more enterprising contemporary has displayed. It may be suggested incidentally that the convenience in the case of water at the barn for cleansing as well as for mixing damp food, is not all of the occasion for concern in applying economy to the water facilities. The same tower can also be made to supply water for the house at least on all the floors of the building at but a trifling additional cost.

The importance of regularity in watering and feeding the stock is too often unappreciated, much as has been said and written in regard to it. Many intelligent men in most respects, too, have not yet determined which policy is the better, that of watering their horses just before eating or afterward. A haphazard plan of leading to the trough when most convenient is still far too prevalent. The lack of judgment in giving the workhorses too much water when warm from excessive work and exercise is not yet confined to the boys. Too often men in appearance as regards height and avoirdupois are far too negligent in this and other seriously important matters. There is, however, the other extreme of being too systematic. Some people lack judgment in applying exceptions to their systematic rules. Such persons whose practice it is to water their animals at fixed hours, never consider the worth of offering a drink more often during the day in very warm weather. This extreme of course is not so important to be observed as the other, where no regular periods are observed at any time of the year. When a team is driven on the road and is destined to make a journey of a score or more of miles it can with advantage be offered water during the progress of the journey in even moderately warm weather once or twice and thus the danger of drinking too much at the termination of the course is generally obviated. In the matter of feeding it is desirable that one know, if possible, the best system. When one is seriously in doubt about the right method it is a safe plan to use a variety of grain and meal, and some variety in the provender. The difficulties attending the feeding of meal alone, unmixed with coarser grain, or chopped hay, as well as a dozen or more other minor points of feeding, are worthy of serious consideration. It is only by an extensive article on the subject of feeding that one can give all the hints which have a place in matters to be fully considered when the question of how to feed is before us. Only some of the more important items of interest can be touched upon at this time. Perhaps the most common mistake in feeding a horse is that of providing too much hay. The animal being intended for work needs to be fed with this idea in view. An overloaded condition of the stomach which requires unusual time for digesting the food, seriously interferes with the driving horse's best usefulness. In the morning or at noon immediately prior to a long drive or any trip in which more than moderate feed is expected, scarcely half the amount of hay should be fed to the animal that is provided in the evening after a day's work. It is also true that the amount of provender provided in the

Digitized by Google

evening or during the day in the case of an idle animal that is only moderately exercised, is to be limited with advantage when a fair amount of grain is provided in connection with it.

It is not desirable to have the horse spending the majority of the time when in the barn, at night or when not at work, eating as it were from "meal to meal." In this respect it is kindness with vengeance unintended where the manger is kept continually well filled, as the animal is given somewhat of a dyspepsia, which prevents the full and proper digestion of its food and thus seriously affects the disposition on the road when a more concise practice would result otherwise. There is, on the other hand, in the case of the work horse a dangerous practice of hurrying at meal time. In too many cases a busy driver expects a horse to limit himself to "fifteen minutes for lunch," the outcome of which is that the animal bolts its feed and acquires a habit of rapid eating, which proves detrimental to it in every way. The driver of course suffers less from this bad practice in that he may with little exertion go with the animal, too often forgetting that his unfortunate pegasus is on foot.

The kind of food to feed the various grades of the equine race is a very interesting as well as highly pertinent question. Most men think that it is always safe to feed oats mixed with a little corn during the moderate weather of the year. It is understood, too, in the colder climate that in the extreme low temperature the quantity of these two grains may at times be reversed with good advantage. It being, as it were, a case of providing fuel so to speak, to keep the animal life in motion, the corn is recognized as supplying not only heat for immediate use, but when fed in sufficient quantity furnishes a reserve in the form of fat to be drawn on by the animal in the emergencies of life when food is limited and the weather unusually cold. In the case of the oats the scientific feeder looks to this as building up and maintaining from day to day the framework and giving permanence to the constituent parts. It is, however, far more important that the growth of muscle be properly promoted by furnishing the right material for its construction in the younger animals than those of more maturity. It is too often forgotten that the youngster's dam is in sore need of a muscle-forming food in the early months of the colt's career. In the case of both the old and the young, especially is this true of the young when just learning to eat, oats is sometimes a dangerous food when furnished alone along with dry provender in the winter season, pasturage and ensilage being not constantly available, as accompanying food. Some shrewd enough men in other things have had many years' experience in this direction and, with it all, have failed to learn that this one kind of grain alone in the absence of the proper complementary food, is often productive of constipation. A system of feeding and constantly observing results and conditions could be the means of saving on every farm very much waste of food when supplied with a lack of observance of the proper methods of mixing and of amount required.

There is no such thing as a printed program of feeding and management at the barn that will enable a manager to be miles away and feel that his system will carry itself along. Some things of course can be done by rule, but the matter of feeding and watering are two of several important items that must be observed with almost constant judgment. Valuable as are the numerous beautiful specimens of the creature that has been dignified by frequent mention in the sacred word, as well as in history, poetry and song, it is perhaps true that, generally speaking, there is to-day as much real ignorance regarding the proper care to be given man's best friend as prevails regarding any domestic animal. In case of the other farm animals and those kept as pets in city and village, they are not called upon to minister to the pleasure of their owners in speed or pleasure trips in which, the occasion having terminated, the interests of the horse who is the chief actor are too often lost sight of. It may be suggested incidentally that while for the last year it has seemed to many that the country was becoming seriously overstocked with the useful creature which every one loves, this fact of

Digitized by Google

neglect is one which almost insures the probability that there will never be too many of the right sort which are needed to supply the popular demand. It is not the intention of people to deliberately neglect the proper care. In our country it is the habit of people, as a rule, to overwork and to neglect proper care of themselves; and this same neglect applies to their friend and faithful servant that is mute in making known to his owner or driver his wants, grievances and sufferings. When man or a member of his family is sick there is usually ability to describe the trouble, and through physicians and surgeons relief may be had before acute physical irregularity has made serious havoc with the constitution of the individual in question. Not so, however, in the case of our mute friend who comes home weary and faint from drawing a heavy load over the stony hills and rough thoroughfares, and finds himself either shut up in a dark damp stall in the barn, with his feed thrown at him hastily, or, as is too often the case in summer weather, is unharnessed and turned directly out to graze without any strong substantial food to rebuild the wasted and broken muscles, and perhaps, too, without sufficient water in reach to quench thirst. And such exceptional neglect is not so rare as we could wish. It is too true that people who have just returned to their homes from the enjoyment of intellectual and elevating entertainments, thoughtlessly deny the necessary provision for our subject, all because they are suffering from slight exhaustion physically, and at times from fancied shortage in a bank account. The same people fail to see that this policy of starving a domestic creature is the worst of economy until it is too late to profit from the observations that this plan has been "penny wise and pound foolish."

There is no period more critical in the management of horses than the time for weaning the young. At least six weeks prior to this, if it has been neglected thus far, a plan must be devised by which the youngsters are provided with grain; if ground partly it is usually better, and they should learn gradually to eat and thus have the necessary food for building up and continuing the growth which the natural food has so far established. As has been above suggested, this should be muscle-forming and bone-supplying material, and should be furnished in such an attractive form that the youngsters will take hold of it with alacrity. The shrewd breeder and handler of young stock will perhaps have observed, prior to this time, that in the case of some of the youngsters they have had insufficient natural milk all along, and has accordingly supplied regularly, every day, a quantity of cow's milk, slightly diluted with water, for the first few weeks. When with the various supplementary grain foods the colts have been brought to the age of twenty to twenty-six weeks, and are clearly eating sufficiently to go right along in growth, the weaning process should be begun gradually. For convenience in the case of both dam and young they may be kept together for an hour every day for a fortnight, being separated the remainder of the time in separate pastures, or, if the weather is stormy, in separate stalls or sheds, and each fed liberally, thus offering every inducement possible to secure the desired quiet. If possible, after the fortnight of almost exclusive separation it is well to halter in separate stalls each mare and her colt side by side, from which time they may be fed and watered liberally and kept entirely from contact. This policy will furnish by far the least friction. Of course, during the progress of this program both should be turned out in separate pastures for two or three hours during the day, for exercise, and where conditions are favorable they can usually be left out in the same way at night. The foregoing suggestions outline one system practiced by many, though there may be other plans that are fully as good and probably superior to this. But there is somewhat of system in this, and whatever improvement for the better condition of the stock in question, this is, of course, only an addition to the systematic work already begun. It may be suggested in this connection that there is far too little thought given to preserving the mares in good condition at this time. Particularly is this important where the winters are severe, and there is as much need of

Digitized by Google

having such broodmares in good condition in milder climates, where there is much rain in winter, as in the more frigid latitudes. Too often the grazing is insufficient, and strong, sustaining grain food is needed. The thoughtful manager will take note of this.

Incidental to the period above mentioned may be suggested the worth of handling of the young colts, and particularly the worth, in their training, of haltering them for a fortnight. It is an excellent program, along with feeding the colts after entirely separated from their mothers, to devise some regular time, once or twice a week, at least, for tying up and feeding. Conservative, cautious people will hesitate about leaving weanlings haltered over night in winter time, and we can see no reason why it should be advisable for more than two or three hours per day while they are eating their grain. When yearlings, however, during their second winter of life, it is more important that they be tied up considerably, and for three or four hours at a time, that they may thus learn before they have very great strength to stand tied submissively. This will be of greater worth to them when, as mature horses, they find themselves hitched and have no other idea from their early training than that they must stand. In this matter of haltering colts, however, there are numerous conditions to be observed, and there is continual call for judgment and for applying exceptions to all general rules. The experienced reader will note mentally, as he reads this, that there is frequent opportunity for accidents from hanging, and bruises from irregular contact with the colt's hitching rein, which must be continually guarded against by an anticipating observation of surroundings.

Among general farmers who do not make a specialty of horse raising, there is far too much neglect of the incidental lessons which can be learned only during the progress of life from birth to mature growth. On this question, however, we will not elaborate, as we refer the regular reader of this magazine to a former article entitled "Incidental Training." It can be alluded to, however, in connection with this article as a part of the system of management which should prevail where a moderate degree of success is to be attained by this class of stock-growers. There are no departments of the work on a stock farm that are more important than this of the incidental training of the growing equine. It has come to be a habit of the stockman to attend to certain work pertaining to the other domestic animals at stated times, and where necessary this is usually repeated with a fair degree of regularity. It is only necessary that such farmers who have neglected hitherto to train their horses, and have simply waited until they were grown, and then have, in the parlance of the farm, with a jerk brought them to time, and have broken them to work in a fortnight—this policy being followed ever after with the condition of affairs that the teamster must always observe and be cautioned of the fact, that the animal in question must be watched, as a not very safe driver. It is amazing, when one thinks of it seriously, that people can be so blunt in their sense of appreciation of the importance of having trained and reliable driving horses. Although the news of the times teems with accounts of runaways and accidents, resulting in serious blemishes to humanity as well as not infrequent deaths, still those who are most concerned are slow to set about the work of lessening the conditions of so much anxiety, and absolute financial loss to breeders and dealers in horses. It is, nevertheless, a fact that if men of wealth and even of moderate means could buy a horse readily that was, in their estimation, a safe and trusty driver, there would be a greatly increased call and much more remunerative prices for such horses.

The fact that there are now so many shy and bad-dispositioned drivers hurts the credit even of a great majority of those drivers who are really trustworthy. There is loud call for a system which shall from birth give the mass of the equine race such training and care that when as mature animals they are sold, their owners and drivers may feel the same assurance of comparative safety that they now feel when boarding a railway train, or a cable, or an electric car.

Digitized by Google

When such results are attained, however, it will be only after there has been a repetition of system at every step and turn in the progress of growth and development of the coming model horse. The foundation must be laid. The best place to do this is the general farm, and when there can be sufficient intelligence and method applied to such an end, the beginning will be fully assured that the later processes will follow in proper order. The careful observer of the conditions in which the young horses are now started in life can but note improvement over former years. The more improved blood and improved individuality in the animal prevails, so much the more does the farmer and his sons give attention to the promise in each youngster. Conscientious care on the part of owners of stallions who know them to be perfect in disposition and of highly satisfactory form and movement, will do much to augment the conditions which will perpetuate the desired improvement. There has been unquestionably in the past few years too much of a disposition to exclude from popular use the best stallions, with the selfish idea of producing only a limited amount of offspring, thus maintaining the high valuation in the case of such a limited number. This system needs revision, and, although it is not within the scope of this article to discuss this fully, it may be suggested briefly that the more such excellent horses are owned for stock purposes by practical breeders and owners of a large number of mares, the better interest they will manifest in widely extending the services of such an animal. Perhaps, too, the same far-reaching policy might be attained fully as well by individuals and corporations owning a good number of first class stallions, and encouraging the owners of mares to patronize on the shares system, or by the still better plan of the stallion owners paying a cash price for the use of the broodmares from season to season. This would result in not only enriching the stallion owner, who would come to have a good share of the interest in the youngsters of a community, but it would also instruct, by valuable object lessons, the owners of mares in the country so that they would come to fully appreciate the value of stallion services. There is another great advantage in this system, which would result in a sort of general supervision of the incidental and general training as well as the feeding and care of the youngsters, who are thus owned either jointly or otherwise, by men who made a specialty of the horse business. The average breeder to-day is usually willing enough to handle and feed, properly, his youngsters, if stimulated to it by an interested quasi-partner, and by the additional incentive of a fair profit that is in sight for his pains. With the attention that is now given stock matters by our agricultural colleges it would seem that there is reason to believe that all along the line farmers are being aroused to greater interest in improved stock which results in more profit and consequently better care. This being true there is no ground for breeders or general farmers losing faith in themselves or in the animal on the farm which is always the favorite and the more desirable in every way to produce when compared with the other domestic animals. No one is encouraged to greatly increase the horse business at present; neither are present attainments to be abandoned.

Systematic training and care, however, are essential in the future in every branch of the business of breeding and handling the roadster, especially where it is intended to pass it on from the hands of the breeder to those who are lacking in ability as drivers or reinsmen. It is only a condition resulting from the rapid improvements and inventions of the times which has brought on as it were for a time a sort of stagnation that compels stock-growers to improve in their methods and adopt the most economical and business-like plans in every proceeding. The great markets of the city are now in condition to protect buyers, as a rule, from serious imposition. A child or a woman can often buy an animal at auction with little danger of imposition, from the fact that the conditions on which an animal is sold are usually those which permit a thorough trial of the horse with privilege of leaving it, if not entirely satisfactory, and as represented. It is a good sign of the times that the

Digitized by Google

lesman are recognizing this demand id there is reason to believe that this stem will inspire confidence more and ore in buyers, and from this practice alone they will be able to vastly increase the calls upon themselves for first-ass and reliable driving horses. However, in addition to systematic care on e part of those who have the first handng and the last, there is a gap between at is more important than either. For ears to come there will be a lack of system in both of the extremes mentioned, nd for various reasons many breeders ust neglect the desired training for their oungsters; and there is now and will ontinue to be strong demand for conscientious, broad-minded dealers and rainers of young horses, who will take ride in establishing for themselves (and name for themselves or their firm) a eputation which signifies that an animal oming through their hands can be relied pon as being all that is desired. One who can see the business policy in such course that will lead to a continually increasing trade, has a sensible and wise forecast of the business career that is opening up before him. Behind every system, however, if ultimate success is to follow, there must be integrity and an honest purpose to do for the public a service whose motto is the golden rule. The interests of the horse business require that there be as few transfers of an animal as possible between the breeder and the one who is to buy the horse for permanent and regular use. To effect this purpose, breeders, as far as possible, should organize and should also co-operate with the general salesmen into whose hands horses finally go, that the transfer may be by as direct a course as possible. When breeders in some way brand their stock and, as it were, follow it with a recommendation of the blood lines and disposition, and the dealer who chances next to come into possession puts his finishing touches and brand of approval upon the animal as to its artificial qualities, then it is that people may buy a finished, reliable roadster.

HAMBLETONIAN'S STUD SERVICE.

HAMBLETONIAN was placed in the stud at the early age of two years. Four mares were bred to him that season free, and the following year (1852) produced three foals, one of which, Edsall's Hambletonian, as he was called while in Orange county, and now known as Alexander's Abdallah, was one of the prominent trotting stallions of that day, though his best record is only 2:42, but after taken to Kentucky he was handled some for speed, and is credited with having trotted several trials in about 2:30. Considering the short time he lived, Alexander's Abdallah proved a successful sire, having to his credit Goldsmith Maid (2:14), the champion trotter and campaigner of her day, and four others in 2:30; also the dams of 32 trotters with records from 2:15 to 2:30, and 13 sires of 125 in the 2:30 list.

The following year Hambletonian's service fee was $25, and 17 were bred, producing 13 foals, of which the great broodmare, Lady Woodhull (dam of Hamilton, 2:26¼, etc.), is the only one of note.

As a four-year-old, with the same service fee, 101 mares were bred, producing, in 1854, 78 foals, among them the famous sire, Volunteer (wagon record 2:37), sire of the champion trotter, St. Julien (2:11¼), and 29 others in 2:40, the dams of 30 trotters, with records from 2:17½ to 2:30, and 29 sires of 88 in the list. Gage's Logan and the famous broodmare, Bell Brandon (dam of Gov. Sprague, 2:20½, Amy, 2:20¼, Wilmar, 2:29¼, etc.), were also of the produce of that year.

The following year his service fee was advanced to $35; 88 were bred, producing, in 1855, 62 foals, among them Edward Everett (2:48), sire of 13 in 2:30, sire of the dams of 12, and 9 sires of 33 in the list, including the champion race stallion, Delmarch (2:11½). Billy Denton with two in the list, one dam and two sires, was the only other producer of that year.

As a six-year-old, at the same service fee, 89 were bred, producing, in 1856, 64 foals, among them the champion trotting stallion and sire, George Wilkes (2:22), with 68 trotters and seven pacers, with

Digitized by Google

records from 2:13½ to 2:30, the dams of 38 trotters and four pacers, with records from 2:11½ to 2:30, and 75 sires of 406 trotters and 82 pacers in the list. The only other sire of that year was Sackett's Hambletonian.

For nine years Hambletonian's service fee remained at $35. As a seven-year-old 87 were bred, producing in 1857, 64, including Lady Augusta (2:30, dam of John S., 2:21¾), Lady Goldsmith (dam of Kate Clark, 2:29½) and Ashcat (dam of Ajax, 2:29, etc.).

When eight years old 87 were bred, producing 63, only one of which acquired distinction, but that one is the champion trotter Dexter (2:17¼, saddle record 2:18, and two-mile wagon race record, 4:56¼.)

When nine years old 72 were bred, producing, in 1859, 54 foals, among them Brunette, that with Bruno trotted in 2:25½, which was faster than any other team performance, Drift (2:29¾) and the sires Reserve and Mott's Independent.

At ten years old 95 were bred, producing 66, which included the six sires, Gideon, sire of two, two sires and the dams of eight (one of which is the champion stallion Nelson, 2:10), Garibaldi, Hetzel's Hambletonian, Robert Bonner, Iron Duke, sire of eight, and Middletown, sire of twelve.

The season he was eleven years old 106 were bred, which was the second time 100 had been reached, and in 1861 there were 72 foals, including Lottery (2:27), Bruno (2:29½), Factory Girl (2:29¼, dam of King Philip, 2:21), Belle of Richmond (dam of Bergen, 2:26¾), Wild Rose (dam of Nutgall, 2:29, and Duquesne, 2:17¾), and the sires William Rysdyk, Bay Billy, Mazeppa, Stephen A. Douglass and William M. Rysdyk.

The following year 98 were bred, and in 1862 produced 68. In proportion to the number, this year's foals amounted to the very least; no one of them entered the list. Heroine was the only producing daughter, and her only performer, Shawmut, has but a single heat in 2:30, and that in a very questionable performance against time, while the sires, Speculation, Felter's Hambletonian, Curtis' Hambletonian and Daniel Boone, have only from three to six each to their credit, and not a single 2:20 performer among their produce.

The season Hambletonian was thitreen years old several of his early produce were showing remarkably well, and as his service fee was announced at $35, which was the same as for eight years previous, 158 mares were bred to him, and produced, in 1863, 111 foals. Harvest Queen, Administrator and Sentinel entered the 2:30 list, and each subsequently produced, which, with Happy Medium, Dictator, Seneca Chief, Banker Messenger, Deceive, Orange County, Ulster Chief, Willie Schepper, Hambletonian Prince, Ledger Girl and Fairy, made fourteen producers of 150, Happy Medium and Dictator being two of the greatest of his sons, and sires of the champion trotters, Nancy Hanks (2:04) and Jay-Eye-See (2:10).

In the fall of 1862, George Wilkes, then called Robert Fillingham, at Fashion course, L. I., in a match for $10,000, had met and beaten the famous Ethan Allen, taking a record the first heat of 2:24¾. This was Hambletonian's first representative in the 2:30 list, and gave him such a decided reputation as a sire that the following year the service fee was raised to $75, but this did not much reduce the number, as 150 were bred that year, and in 1864 produced 92, including Jay Gould, who reduced the stallion record to 2:21½, Hamperion (2:29½), Young Bruno (2:22¾), Harold (sire of the champion trotter, Maud S., 2:08¾), Peacemaker, Idol, Hotspur, Duke of Brunswick, Lysander, Macedonian, Bay Richmond, Prosper, Regulus and Belle (dam of Elmer, 2:22¼).

As 150 was considered rather excessive service, it was decided to place the service fee for the following year at $100, which was the first time a trotting stallion had commanded so high a fee. Hambletonian was then fifteen years old, and so highly was he regarded as a trotting sire that 217 were bred to him that season, producing, in 1865, 150 foals, among them Gazelle (2:21), Effie Deans (2:25½), Lady Banker (2:23) and the sires Messenger Duroc, Rysdyk, Walkill Chief, William Welch, Buckingham, Chosroes, Jack Shepard, Lakeland Abdallah, Mapes Horse, Milwaukee, Reporter, Samson,

Digitized by Google

Knickerbocker and Virgo Hambletonian; also the broodmares Lady Morgan (dam of Alvan (2:24), Merriment (2:25½) and Marion (2:26¾), Goshen Maid (dam of Bartholdi, 2:30), Miss Brunette (dam of Black Prince, 2:25½), Louie (dam of Dawson, 2:19¼), Caro Nomo (dam of Bob Acres, 2:28¼, etc.), and Quida (dam of Trinket, 2:14, etc.).

By this time George Wilkes had proven a famous trotter, Dexter had made a good beginning. Shark had won several remarkable races, one of which was a three-mile-heat race, and expecting to thus reduce the number of services to 100 or less, the fee was placed for the next year at $300, but notwithstanding this was so far above what any trotting horse breeders had ever before paid, 193 were bred, and the produce in 1866 was 128. This was 67 per cent., the same as the year previous, which is regarded as a fair percentage even for a much smaller number, and considering that many which were bred were quite old road mares, such a percentage is really remarkable.

Among the foals of that year were the sires Strathmore, Aberdeen, Echo, Socrates, Squire Talmadge, Gen. Stanton, Blue Grass, Brougham, Charles Backman, Dexter Bradford, Goodwin Hambletonian, Hamilton, Imperial, Oak Hill and Orion, also the broodmares Alley (dam of Wilton, 2:19¼, Albert France, 2:20¼, Alley Russell, pacer, 2:22¾), Rysdyk Maid (dam of Bloomfield, 2:19¼), Duchess May (dam of Duchess Russell, 2:26½), Lady Jane (dam of Harry Pelham, 2:28½), Rose Terry (dam of Neli, 2:27), and the fast trotters, Nettie (2:18), next to the fastest of all his get, Chester (2:27), James Howell Jr. (2:24), Lottie (2:28), Scotland Maid (2:28½), and Small Hopes (2:26½), that with Lady Mac trotted a public exhibition mile in 2:23.

As Dexter now held the fastest trotting record, and George Wilkes was acknowledged the king of trotting stallions, it was decided, on the advice of a very few intimate friends, to place Hambletonian's service fee permanently at $500, which was such an unheard-of price it was not supposed the applications would be very numerous. Hambletonian was then 17 years old, and that year 105 were bred, while quite a number were refused. There were 75 foals in 1867, among them Deucalion (2:22), Bella (2:22), Mattie (2:22¼), Breeze (2:24), making the four fastest for any one year, in addition to Racola (dam of Orange Boy, 2:18¾), Vara (dam of Vatican, 2:29¼, etc.), Ulster Queen (dam of Volmer, 2:21¼), and the sires Victor von Bismarck, Sweepstakes, Startle, Ajax, Banker, Blackstone, Dauntless, Florida, Kent, Menelaus, Mercury, New York and Peter Story.

The next year the severe fee remained the same, but only 72 were accepted, as the horse was not quite up to his former condition. There were only 42 foals in 1868, which was the smallest percentage of any year but the last, but half of those already have representatives in the 2:30 list including Electioneer, the greatest son, and Fleetwing, the most famous daughter. Marguerite took a record of 2:39, Ella Madden 2:25¾ (dam of Burnette, 2:23¾), and Enfield, 2:29, which is also one of the sires. Electioneer was the first to have 100 in the 2:30 list, and has had all the most important champion records credited to his offspring, including the fastest stallion record. The other sires for 1868 were Masterlode, Cuyler, Wilkins Micawber, Twilight, Romulus, Norwood, Lancewood, Black's Hambletonian, Elevator, Broken Leg, Barkis and Schuyler Colfax. Fleetwing is the dam of Stamboul (2:11) and Ruby (2:19¾), Lucia (dam of Day Dream, 2:21¾, etc.), Undine (dam of Monopoly, 2:29½), while Juno is the dam of Greenlander (2:15¼), Earl (2:23¾) and Naomi (2:25); consequently 1868 must rank as the banner year.

Early that spring Hambletonian was very sick, undoubtedly partly on account of the excessive service for several years previous. For a time it was thought he could not live, and it was decided that he should do no service that season, consequently there were no foals by him in 1869.

For each of the following years the service fee remained at $500, but each year it was decided that his limit should not exceed 30. When 20 years old 22 were served, and owing to the reduced number, as well as the complete rest the year before, there were 18 foals in 1870,

Digitized by Google

making 81 per cent., which was the highest percentage reached during his whole career. Of these Jerome took a record of 2:27, Astoria, 2:29½. Octavia is the dam of Octavius (2:26¼), while Artemus, August Belmont, Ridgewood and Peter are the sires of that year, making a high average, though no one has become particularly distinguished.

At 21 years old the same number were bred. and there were 16 foals in 1871, of which Orange Girl took a record of 2:20, Lorette produced Greenbacks (2:23¼), and Auditor, Chester Chief, Corsair, Hamblehawk and Ryseduke are the sires for that year.

At 22 years the full limit of 30 were served, and there were 26 foals, Alma taking a record of 2:28¾, Pickering 2:30, Rysdyk Maid, 2:24¼; Emelia has produced Orpheus (2:30), and Haw Patch, Polonius, Pickering, Richwood, Montagu, Mohican are the sires.

At 23 years there were also 30 bred, and in 1873, 24 produced. Artillery took a record of 2:21½ and Kisbar 2:27¾, each of which is a sire, as well as Arthurton, Bona Fide and Dean Sage, while the producing daughters are Camille (dam of Louise 2:19, and Eloise, 2:30), Boadicea (dam of Darlington, 2:25), Aida (dam of Aida de Clare, 2:26½), Beatrice (dam of Alsie, 2:29,) Isabelle (dam of Carlisle, 2:22¼) and America (dam of Benton, 2:20¾, and Bonnie, 2:25), which makes a high percentage of successes for that year.

At 24 years old the limit was slightly exceeded and 31 were bred, but only 20 produced in 1874. Neither of these entered the 2:30 list, but Ozone is the dam of Geneva (2:19¼), Katie Clark is the dam of Shipman (2:24¼), and Sadie produced Silver Bow (2:22¼), while Alert Kensett and Walkill Prince are the sires.

At 25 years the limit was again exceeded, and 32 were bred, producing 24 foals, which included such good ones as Madeline (2:23¼), Coralie (dam of Borden, 2:29½) Reina Victoria, four of whose five foals are already in the list, while the fifth has shown ability to even enter the 2:20 list, and Egbert already has 40 to his credit, which is more than any other has had at the same age. Sir Walkill, Sherman's Hambletonian, Marlborough and Leland were also among the foals of this year.

Hambletonian's last season was in 1875. He was then 26 years old, and was perceptibly failing, still there were plenty of applications, 24 of which were received, but only two proved with foal. One of these, the last sired by the famous horse, and foaled in 1876, after the death of Hambletonian, was appropriately named Hambletonian's Last. This horse took a record when eight years old of 2:25¼.

We have not at hand the dates at which the following producing daughters of Hambletonian were foaled: Bay Hambletonian (dam of Henrietta, 2:17¼), Compromise (dam of Result, 2:25), Lady Burchard (dam of Amboy, 2:24¼), Molly Pitcher (dam of Sally Scott. 2:18¼), Nell (dam of Bateman, 2:22), Sally Jones (dam of Capadura. 2:30), Zelipha (dam of Bob Pinkerton, 2:30), Fields Mare (dam of David L., 2:19½). Lady Carpenter (dam of Eph, 2:24¾) and Lady Ham (dam of Hugh McLoughlin, 2:23).

Hambletonian died March 27, 1876, having made 24 seasons, during which a total of 1,931 were bred to him, an average of a little over 80 a year, from which there are known to have been 1,336 foals (this includes three not generally credited, one of which was from the Kent Mare, his own dam, which was not credited to Hambletonian, because foaled weak and crooked, but we have positive evidence that this one and two others were by him and should be properly credited) which is a total average of about 70 per cent. Reckoning a payment to have been made for only such services as proved fruitful, Hambletonian's total earnings would have amounted to $207,-950. and it is probable payments were made in numerous other cases.—"*Vision*" *in American Horse Breeder.*

The sale of thoroughbreds at Doncaster, England, on September 13, was well attended by American breeders. Dr. Horace Theobold bought three yearlings, paying $2,425 for the three. Marcus Daly paid $4,500 for a bay colt by Hampton. Mr. Reed paid $14,050 for five mares. A bay colt by Minting-Reprieve was sold to Blumdell Maple for $22,500.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less for single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00

The Young Trotters of 1892.

ALTHOUGH the trotting season of 1892 is practically closed as this number of the MONTHLY goes to press, there are, nevertheless, so many meetings in progress just at the heel of the campaign, that there will be far more accessions to the 2:30 and 2:20 list than any one not thoroughly posted as to the possibilities of the American trotting horse could possibly have imagined.

The MONTHLY, having in mind the fact that a comprehensive tabulation of what has been done by the young trotters of the year will be of interest to every one who has the welfare of the light-harness horse at heart, has compiled and presents herewith a list of the trotters and pacers, three years old and under that have entered the 2:30 list during 1892. As the story of what these youngsters have accomplished would be incomplete unless something concerning their blood lines was also furnished, the name of the sire of each performer is given, and when that sire has a record the fact is likewise noted. It is not claimed that this list is an absolutely correct and comprehensive one or that it brings down in each instance the history of the performer later than the 20th of October, but at the same time it may properly be said that it has been compiled with care from the best sources obtainable and the information contained therein is believed to be practically correct. The results in brief up to the time mentioned as concerns the number of yearlings, two-year-olds and three-year-olds that have entered the 2:30 list this year may be summarized as follows:

Yearlings.....	3
Two-year-olds.....	49
Three-year-olds.....	116

As to the breeding of these young trotters and pacers, it will of course be noted that in the male line the preponderance of Hambletonian blood is, as usual, very great, and it will also not escape general attention that with no more exceptions than go to prove the rule, these horses are by developed sires. For instance the sires of all but nine of the forty-nine two-year-olds have records ranging from 2:08½ to 2:31¾, and in this list of sires of two-year-olds that beat 2:30 in 1892 are to be found the following stallions with records of 2:20 or better:

Name.	*Record.*
Stamboul.....	2:08½
Palo Alto.....	2:08¾
Axtell.....	2:12
Thistle (p).....	2:14
Patron.....	2:14¼
Guy Wilkes.....	2:15¼
Wayne Wilkes (p).....	2:16
Jerome Eddy.....	2:16½
Dellneator (p).....	2:18
C. F. Clay.....	2:18
Sable Wilkes.....	2:18
Shadeland Onward.....	2:18½
Ashland Wilkes.....	2:19¼
Bell Boy.....	2:19¼
Wilton.....	2:19¼
Abbotsford.....	2:19½
Ansel.....	2:20

Here then we find that sixteen stallions with records of 2:20 or better are represented in the list of sires comprising all the animals that have begotten two-year-old trotters which entered the list in 1892, and their total contribution to that list is nineteen out of forty-nine, as Axtell, Shadeland Onward and Sable Wilkes are responsible for two performers apiece. And right here it is in order to call attention to the fact that these three stallions, each one of whom has had two two-year-olds enter the list this season, are young horses, Shadeland Onward having been foaled in 1883, Sable Wilkes in 1884 and Axtell in 1886. More than this, two of them, Sable Wilkes and Axtell, held the champion three-year-old stallion record in their day with marks re-

Digitized by Google

spectively of 2:18 and 2:12. Sable Wilkes has both sire and grandsire in the 2:30 list, their average record being 2:18½. When to this is added the 2:18 mark of Sable Wilkes himself it will be seen that the sons and daughters of the last-named horse have an average speed inheritance of about 2:18⅓ for three generations, and it is no wonder that under such circumstances they take naturally to the trot and go fast at that gait when still at a tender age. The sire of Axtell has no trotting record, but he can speed better than a 2:30 gait and is brother to the sire of Sable Wilkes, so that in the male line the same strains of blood are combined in the pedigrees of Axtell and Sable Wilkes. It is therefore a significant fact and one full of gratifying information to breeders that horses so nearly related as Sable Wilkes and Axtell should not only themselves be three-year-old champions, but should produce standard speed while still young in years, and have this speed show itself in their progeny at two years of age. Shadeland Onward, the other sire that has two two-year-olds to his credit in 1892—one of them the champion two-year-old pacer—and that is also the sire of the champion yearling pacer, one that has a record of 2:21¼, is, like Sable Wilkes and Axtell, a member of the Wilkes family, being by Onward, 2:25¼, he by George Wilkes, 2:22. The dam of Shadeland Onward is a member of the Mambrino Patchen family, as she is a granddaughter of Mambrino Patchen, and in examining the pedigree of Axtell this same strain of blood is prominent, as his dam is by Mambrino Boy, 2:26½, a son of Mambrino Patchen. The dam of Mambrino Time, sire of the dam of Shadeland Onward, was largely a thoroughbred, he being by Mark Time, a son of Berthune; while the dam of Mambrino Boy, sire of the dam of Axtell, was by Cassius M. Clay; second dam by Berthune, so that in the remote crosses of the maternal lines of these pedigrees there is somewhat of a similarity, as well as in the near ones. The dam of Sable Wilkes was by The Moor, son of Clay Pilot, which latter horse was by Neaves' Cassius M. Clay Jr., a son of Cassius M. Clay, 18, and as the dam of Mambrino Boy was by Strader's Cassius M. Clay, another son of Cassius M. Clay 18, there is developed another potent similarity in the general blood lines of these three great young sires.

Looking at the matter in another light, and starting with a 2:20 standard for the two-year-olds of the present season, it is found that seven in this year's list are eligible to this condition, they being:

Name.	*Record.*	*Sire.*	*Record.*
Online (p)	2:13¾	Shadeland Onward	2:18¼
Silicon	2:15¾	Wilton	2:19⅛
Rowena	2:17¼	Bonnie Boy	
Bonnie Belle (p)	2:18¼	Sable Wilkes	2:18
Sabledale	2:18½	Santa Claus	2:17½
William Penn	2:18½	Azmoor	2:20½
Princess Royal	2:20	Chimes	2:30¾

Six of the seven two-year-old trotters and pacers that have beaten 2:20 this season are by developed sires, and under this severe test Sable Wilkes and Shadeland Onward are again prominent, while Axtell drops out, but his place is more than taken by another member of the Wilkes family, Wilton, who from a mare by the trotter Hambrino, 2:21¼, has sired a wonderful two-year-old in Silicon, whose record of 2:15¾ was made in a race against other horses. The Wilkes family is therefore well represented in this list by Shadeland Onward, Sable Wilkes and Wilton; while Santa Claus, a son of Strathmore, brings that branch of the Hambletonian family prominently to the front through the race record of 2:18½ made by his son William Penn. Chimes and Azmoor represent Electioneer, being his sons, and those who believe in a close thoroughbred cross will not overlook the fact that Azmoor's dam is a thoroughbred mare. With six of the seven two-year-old trotters and pacers that have beaten 2:20 this season, sired by horses with records ranging from 2:18 to 2:30¾, it is beyond question that the developed-sire idea has come to stay, and it is also evident that under this test, as in the case of nearly all others, the Wilkes and Electioneer branches of the Hambletonian family are far in advance of all other strains of blood.

Coming now to a consideration of the 2:30 or better three-year-olds of 1892, it is found that seventy-seven of the 116 horses in the list were sired by developed stallions, and that thirty of them are by stallions with records better than 2:20. These sires are:

lton	2:19¼	2

The analysis of this list of 2:30 or better otters and pacers for 1892 has been thorghly made, for the reason that it is only by mparisons of this sort that the whole truth n be shown. Nothing is more misleading an a great performer by a sire who, aside om that particular instance, has perhaps acmplished nothing. Naturally when a trotr or pacer enters the list at an early age or isplays remarkable speed, attention is first irected to its sire, and some measure of credit iven to him, whereas in not a few cases the am is far more responsible for the excellence f her produce than is the sire. Therefore it only by examining the facts from different andpoints that a deduction which is oftenmes irrefutable can be made.

The complete list of trotters and pacers hree-year-olds and under, that became standrd by performance in 1892, up to October 20, s follows:

Gelded Sons of George Wilkes.

THE bay gelding Albert France, record 2:20¼, died the other day in Connecticut, having been owned for a number of years by a resident of that state who used him on the road. Like some other sons of George Wilkes that were gelded in their youth Albert France would have been a horse of great value had he been left entire, as in addition to being a first-generation Wilkes he was out of a mare by Rysdyk's Hambletonian that also produced Wilton, 2:19¼; and as the last named horse is prominent among the sons of George Wilkes as a sire, especially since his daughter Silicon has shown herself one of the best two-year-old trotters ever foaled, taking a race record of 2:15¾ and winning a number of rich stakes, it is only reasonable to suppose that had his brother Albert France been left entire one more would have been added to the already long list of sons of George Wilkes that have sired trotting and pacing speed.

The bay gelding Anglin, brother to the successful sire Wilkes Boy, is another instance of where, in all probability, a good sire was lost to the world by the use of the knife. In the case of Harry Wilkes, 2:13½, it was no doubt for the best that he was not kept entire, as lack of size is certainly not to be commended in any stallion whose get are intended for driving purposes, and one fault of the Wilkes family is this tendency to breed unevenly. Joe Bunker is another son of George Wilkes that should have made a grand sire had he not been gelded, as his dam was the American Star mare Lady Dunn, whose daughter, bred to George Wilkes, produced two cracking sires in Guy Wilkes and William L. It can hardly be argued, in view of what Rysdyk's Hambletonian accomplished on the American Star mares that George Wilkes would not have been a good cross for Lady Bunker in the matter of producing speed that would breed on, and in the case of Joe Bunker he certainly did well, giving the world a trotter that beat 2:20 in a race and was good in any kind of company.

J. B. Richardson should also have shone in the breeding ranks. His record of 2:16¾ proves him to be a horse of more than ordinary speed, and that he is possessed of immense vitality his half dozen successive campaigns since he reached maturity amply attest. More than this, he is bred right in the female line, his dam, a daughter of Almont, having also produced to the cover of the converted pacer Smuggler the stallion Lace Dealer, 2:27½, and as Smuggler had no trotting inheritance it is only fair, in the case of Lace Dealer, to give the Almont mare that produced him credit for his ability to beat 2:30. And then there is the big gelding Magna Wilkes, record 2:22½. He was from the old trotting mare Molly, a daughter of Magna Charta. The Magna Charta mares that had produced to the close of 1892 trotters with records of 2:30 or better numbered twenty, and among the foals which came from them are Jack, 2:12; Belle F., 2:15¼; Emma E., 2:19¼, and George V., 2:20. The dam of Magna Wilkes also produced the pacer Shamrock, 2:27½, and as her son by George Wilkes is a big, good-gaited horse with lots of nerve force he would unquestionably have done well in the breeding ranks.

Mike Wilkes is another member of the fam-

Digitized by Google

ily for whose gelding regret has often been expressed by horsemen. He was a bay in color, of good size and conformation, and had speed enough as a trotter to beat 2:20, having been given a trial early in life at that way of going in 2:20½. A horse of naturally riotous disposition, he was not handled with the gentleness that should have been a feature of his education, and finally he became so track sore and digusted with life generally that it was a matter of some danger to drive him. As he had always manifested a disposition to pace he was finally permitted to assume that gait and took a record of 2:15¾. Later in life he was again put to trotting, making a record of 2:26½. His brother Adrian Wilkes is the sire of Roy Wilkes, 2:07¾; Lillian, 2:14½, and several others of merit as trotters and pacers, while another brother, Ira Wilkes, is standard by performance at both the trot and pace, in addition to which he is represented in the 2:30 list by his get.

Wilson is a son of George Wilkes that if left a stallion should have accomplished much in the stud. He was a great race horse, and that he was fast his record of 2:16¼ proves. And his dam's breeding was of the right sort to nick well with the blood of George Wilkes, she being a daughter of Clark Chief, dam by American Clay. That she was a mare of positive merit in the production of speed her three trotting representatives in the 2:30 list prove, in addition to which her son Abdallah West, by Allie West, a son of Almont, has a 2:30 performer. Last on the list comes the black gelding Jimmy Temple, that has a record better than 2:25 at both the trot and pace. He is from a Mambrino Patchen mare and is brother to Jersey Wilkes, sire of Chiquerita, 2:16¾ as a four-year-old, and others. No gamer racehorse than Jimmy Temple ever lived, and does anybody doubt that he would have been even more successful in the breeding ranks than has Jersey Wilkes? After George Wilkes became famous as a sire there was no gelding of his sons, and through what was done in this direction in the early days of the great stallion's stud career many a man threw away a fortune.

Sires of the Season.

Up to the 20th of October, less than 114 sires of trotters and pacers were credited with three or more of their get becoming standard by performance this season. Of these 114 horses that have demonstrated that they possess more than average merit as sires by the records of this season alone, sixty-nine, or nearly two-thirds, have records, while twenty-three are credited with marks better than 2:20, in this list being Stamboul, 2:08½, who makes about as good a showing as any horse of his age with a record better than 2:15. Of course such a list as the one given below, while of interest and value to breeders, is necessarily incomplete, and while not in any way misleading, still omits a good many stallions that have perhaps at a very early age put two of their get in the list this season. Axtell, 2:12, a six-year-old, with two two-year-old trotters in the 2:30 list, is an instance of this sort. It is, of course, impossible at the present time to make a comprehensive tabulation of what the sires have accomplished this season, but the close of the trotting year is so near at hand that a table such as the subjoined one gives a good idea of the situation. The list is as follows:

Name.	*Record.*	*Number in List.*
Aberdeen		4
Abbottsford	2:19½	3
Abdallah Mambrino		3
Abdamed Allen		3

The Drivers' Association.

THERE have been at various times efforts made in the direction of forming a society which should include in its membership drivers and trainers of trotting horses, but until the meeting called in connection with the recent two weeks of trotting at Lexington the matter never took definite shape. At the time referred to, however, there was a representative attendance of drivers from all parts of the country, and with very little formality an organization was effected.

The general scope of the society, as stated in the constitution, is to promote unity among drivers, protect their interests, and elevate the profession. It is provided that any professional driver or trainer of trotting or pacing horses who is in good standing with the National and American Trotting Associations, and any apprentice to the business under a professional driver or trainer, and who is of good moral character, shall be eligible to membership. The officers are president, vice president, secretary, treasurer and board of governors, which latter body consists of the president, vice-president, and ten members, all of whom shall be elected annually. It is also provided that all funds collected shall be deposited in a national bank and drawn therefrom only by the order of the president, countersigned by the secretary and treasurer. An annual meeting is to be held. The initiation fee is $2, and a like amount is payable each year for dues.

Charles Marvin was elected president, and Crit Davis, vice-president. The board of governors is composed of the following well-known drivers: James Golden, Boston, Mass.; E. F. Geers, Buffalo, N. Y.; M. E. McHenry, Geneseo, Ill.; C. W. Williams, Independence, Iowa; Peter V. Johnston, Kalamazoo, Mich.; R. E. Curry, Nashville, Tenn.; Sam Fuller, Missouri; John A. Goldsmith, San Francisco, Cal.; Richard Tilden, Kansas, and Dr. J. W. Day, Waterloo, N. Y. It will be noted that the personelle of the association, so far as its officers are concerned is of the best, and under their direction the Trotting Horse Drivers' Association of America cannot fail to be a potential and beneficent factor in the conduct of the American trotting turf. Charles Marvin is known from one end of the country to the other, not only as an expert in his profession and the best handler of colt trotters ever seen, but also as a man of good motives, high purpose and the strictesr integrity. Crit Davis is a representative Kentuckian, and his following among owners and breeders, like that of Marvin, comprises only the best material. The members of the board of governors are almost without exception men of great skill in the handling of trotters, and Golden, Geers, McHenry, Williams and Goldsmith are of consequence financially as well. It is to be hoped that the high purpose of the Association as set forth in its constitution will not be deviated from through feelings of personal friendship. That there will in the near future be occasions when the members of the association will be called upon to choose between duty and friendship for a fellow driver is not to be doubted. In any large body of men there will be more or less base material, and the trotting turf is no more freer from this dross than any other business or walk of life. The trotting horse interest of this country is a stupendously large and important one from a financial

Google

standpoint, and its permanent success depends upon the honesty of its conduct. No other class of men can do as much to maintain a high standard of morals on the trotting turf as those who drive and train the horses. Certain of their number are known to the public as the promoters of disreputable schemes, and it is only by the prompt and severe punishment of this element that the profession can be kept at so high a standard as to command the respect and confidence of everybody. There is no occasion at this time to particularize. A good start has been made. Let us hope the finish will be equally creditable to all concerned.

The Beautiful Bells Family.

ELECTIONEER now has twenty-six trotters in the 2:20 list, a showing which completely discounts the performance of any other stallion in this particular, as no other horse in the world has more than fifteen 2:20 trotters to his credit. The latest one of Electioneer's get to beat 2:20 is Bow Bells, that is a member of the famous Electioneer-Beautiful Bells family, he taking a record of 2:19¼ in a winning race. As Belleflower, a daughter of Beautiful Bells, has also entered the 2:20 list this year, Beautiful Bells now has seven of her produce that are standard by performance, among them the yearling filly, Bell Bird, while three of her produce have beaten 2:20 at three years, so that in point of producing extreme speed at an early age this developed trotter with a record of 2:29½ and whose sire, The Moor, was another developed trotter, stands in advance of any other mare in the world. More than this her sons, Bell Boy, Chimes and St. Bel, are sires of 2:30 speed at a very early age, and one of her daughters produced Mont Rose, that last season, as a three-year-old, made a record of 2:18. The producing record of Beautiful Bells now stands as follows:

Belleflower (3 years)	2:16½
Bell Boy (3 years)	2:19¼
Bow Bells (5 years)	2:19¼
Hinda Rose (3 years)	2:19½
Palo Alto Belle (3 years)	2:22½
St. Bel (4 years)	2:24½
Bell Bird (1 year)	2:26¼
Chimes (3 years)	2:30¾

Here are seven trotters in the 2:20 list from one mare, the slowest record of the lot being the 2:26¼ mark of a yearling, which at the time it was made was the best performance on the books for a trotter of that age. Hinda Rose, whose record is 2:19½, when three years old, was also a yearling champion in her day. Chimes is not fairly represented by his record of 2:30¾, as any season since it was made he could have beaten 2:20 had Mr. Hamlin trained him, but it is not just that his three-year-old mark, although it does not make him standard, should be forgotten, because he has proven himself a phenomenal sire of speed, having this season been represented on the turf by the two-year-old trotter, Princess Royal, 2:20; Midnight Chimes (3 years), 2:16¼; Chimes Boy (4 years), 2:25½, and Merry Chimes (4 years), pacing record 2:14¾. Chimes is only eight years years old, and as his daughter, Chimes Girl, made a two-year-old record of 2:26 last season, it will be seen that he now has five representatives in the 2:30 list, their average age being exactly three years and their average record 2:20½. There was never any other sire to make a showing which approached this when his own age, the age of his 2:30 representatives and their average speed is taken into the calculation and it demonstrates conclusively that the blood of Electioneer and Beautiful Bells, the union of which produced such wonderful results in the first generation, is breeding on with remarkable prepotency in the second. The early death of Bell Boy is all that prevented him becoming a great sire, as one of his get entered the 2:30 list last year when Bell Boy, had he lived, would have been only six years old. St. Bel also is dead. He was foaled in 1882 and already had four 2:30 performers. It is a certainty that unless Bell Bird breaks down, she will trot to a record better than 2:20, and as Beautiful Bells is still producing regularly it is impossible to estimate the number of her direct descendants that will in time enter the 2:30 list, but it is safe to say that as she leads all other mares in the world of her age, the chances are that she will eventually become the greatest trotting broodmare in every particular. But on what she has already accomplished Beautiful Bells has placed her name where it will ever be distinguished in trotting annals, and this being the case it is impossible to avoid the conclusion that a great proportion of her merit is due to the fact that she herself was possessed of remarkable speed at the trot —far more than is indicated by her record of 2:29½—as it is the testimony of her breeder, Mr. L. J. Rose, that at the time this record was made, Beautiful Bells was a very unreliable mare in races, being certain to make a break almost as soon as the word was given and con-

Digitized by Google

sequently compelled to trot a good deal faster than her opponents in order to win. In a trial against the watch she could probably have gone a mile close to 2:20. It is also not to be disputed that both the sire and dam of Beautiful Bells were rather above the average of their day in point of trotting speed. The best record of The Moor is 2:37, but Mr. Rose has given testimony to the effect that even with the handicap of bad handling the stallion could trot in 2:32, while Minnehaha, the dam of Beautiful Bells, was a phenomenally fast trotter, but was butchered and so crippled by an ignorant driver that it was impossible to train her. A great deal has been said of late years about the alleged fact that nearly all great broodmares possessed an immense amount of what is variously known as courage, vim, nerve force, etc., this has been said of both Beautiful Bells and Minnehaha, and it is unquestionably true that in their youth they were mares of great determination. But the important fact that they were also possessed of speed and that they came of trotting ancestry is the principal one to be considered and tied to.

Some Record Breaking.

THERE was such a wholesale slaughtering of records at the Nashville, Tenn., and Mexico, Mo., trotting meetings which were held during the week ending October 22, that the different performances—all but one of which were made in races—are worthy of special mention. Here are the records that were established:

Race record for yearling pacers—Mill Lady, by Count Wilkes; dam Mill Girl, 2:22¼, by Jay Gould, 2:21½ 2:30

Race record for yearling trotters (at Mexico)—Leone, by Lancelot, 2:27½; dam by Monon, son of Nutwood 2:28½

Race record for yearling trotters (at Nashville)—Nelly A., by Wilkes Boy, 2:24½; dam Wilksie G., 2:22½, by Robert McGregor, 2:17½ 2:29¾

Race record for two-year-old trotters—Silicon, by Wilton, 2:19¼; dam by Hambrino, 2:21¼ .. 2:15¾

Race record for three-year-old trotters and best three heats by a trotter of that age—Directum, by Director, 2:17; dam by Venture, 2:27¼ 2:15, 2:12, 2:11¼

Best four consecutive heats in a race—Jack, by Pilot Medium won the first heat, and Little Albert, by Albert W., 2:20, the next three heats 2:12, 2:10¾, 2:11¼, 2:10¾

Two-mile trotting record (against time)—Nightingale, by Hamlin's Almont, 2:26; dam by Wood's Hambletonian 4:43¼

This is the story in brief, but something further concerning these horses of various ages that have shown themselves real champions by going out against the whole world for the money and the records and getting them, will be of interest. In the case of the yearling pacing filly Mill Lady attention is at once drawn to a remarkable broodmare, Mill Girl, that although not retired from the turf until 1887, during which season she made a record of 2:22¼, has four foals in the 2:30 list. In other words, her foals for 1888, 1889, 1890 and 1891 have entered the 2:30 list as follows:

Name.	*Foaled.*	*Record.*	*Entered List.*
Wilkes Girl	1888	2:28¼	3 years
Capitana	1889	2:30	2 years
Wilkes Maid	1890	2:25⅛	2 years
Mill Lady (p)	1891	2:30	1 year

It is doubtful if any other mare with no greater term of service in the breeding ranks than Mill Girl can make anything like as good a showing as this, all things considered, because not only have all her foals since 1887 become standard by performance, but every one got in the list at four years old or under, she having now a 2:30 representative in the yearling, two-year-old, three-year-old and four-year-old classes. Mill Girl produced one other foal that is now owned in Massachusetts and said to be able to trot close to 2:30. Of her produce above mentioned the first three are by Young Wilkes, 2:28¼, a son of George Wilkes, while Mill Lady is by Count Wilkes, also a son of George Wilkes. In view of the wonderful accomplishments of Mill Girl in the brood mare ranks, her blood lines are of interest. She is by Jay Gould, 2:21½, he by Rysdyk's Hambletonian and out of an American Star mare, thus combining what were the fashionable crosses of blood at the time he was foaled. Jay Gould may fairly be termed the champion trotting stallion of his day, inasmuch as he won every race in which he started, six in number, beating in these events Lucy, Thomas L. Young, William H. Allen, Huntress, Pilot Temple, Pat Ring, Elmo, Bashaw Jr. and Sensation. That under the conditions prevailing at the present day Jay Gould's record of 2:21½ would have been reduced to about 2:15 is not to be doubted, as he was a natural trotter, remarkably pure gaited, and with a great flight of speed. In the stud he has succeeded far better through his daughters than his sons, as to the close of 1891 only seven of the latter had sired trotters and pacers with standard records, their total contribution to the list being thirteen, while thirteen of his daughters had pro-

Digitized by Google

duced twenty-one trotters, and when it is considered that a mare can at best produce only one foal a year, while a stallion may sire thirty or forty colts, it is evident that there is no comparison at all between the success of Jay Gould in the maternal line as compared with the male side of the house he has established. One of his daughters, Lucia, that is out of the old-time trotter Lucy, 2:18¼, she by George M. Patchen, 2:23½ (himself a champion of the olden time), has produced five trotters with records ranging from 2:19½ to 2:30, in addition to which a daughter is the dam of Trapeze, 2:29½. Now comes Mill Girl, a developed daughter of Jay Gould, with all her foals since 1887 in the 2:30 list, their performances being made at from one to four years of age. In the female line, so far as her history is known, Mill Girl is a short-bred mare, her dam being Dolsey by The Shaeffer Pony, a pacer. Dolsey, however, was of more than average merit as a producer, as she is also the dam of Mill Boy, 2:26. All of Mill Girl's foals in the 2:30 list are by sons of George Wilkes, three of them by Young Wilkes, that has a record of 2:28¼, and although Count Wilkes, the sire of the yearling pacing filly out of Mill Girl that has just entered the 2:30 list, is not credited with any mark of 2:30 or better he is nevertheless a brother to Gambetta Wilkes, 2:22½, and The King, 2:29¼, all three being by George Wilkes and out of Jewel by Vermont, 104. In the case of Count Wilkes and Mill Girl we have a strongly bred trotting stallion and a trotting-bred mare with a record of 2:22¼ producing a pacer which enters the 2:30 list as a yearling in a race, and it is also a significant fact in this connection that more than half of the get of Gambetta Wilkes, the brother to Count Wilkes, that have become standard by performance are pacers, his list of sidewheelers including Don Pizarro, 2:14¾ at three years; Gusto, 2:19¼ at two years; Lottie Loraine, 2:16¼ at two years; Georgie Lee, 2:20¼ at two years, and Don Lorenzo, 2:17¾ at three years. This is the family tree of the pacer that has reduced the yearling race record to 2:30.

Nelly A., who at Nashville reduced the yearling race record for trotters to 2:29¾, is by Wilkes Boy, 2:24½; he by George Wilkes, 2:22, and out of Betty Brown, by Mambrino Patchen; grandam by Mambrino Chief. Wilkes Boy, therefore, has a double cross of Mambrino Chief on one side of his pedigree, while the other leads direct to Rysdyk's Hambletonian. This stallion, bred to the developed mare Wilksie G., 2:22½, by Robert McGregor, 2:17½, by Major Edsall, 2:29, by Alexander's Abdallah, by Rysdyk's Hambletonian, sired the champion yearling race trotter in Nelly A. She traces to Rysdyk's Hambletonian in both lines of her pedigree and in the race where her record was made she won by a head only from another representative of the Hambletonian family in Conformation, a daughter of Cuyler.

Leone (whose 2:28½ mile at Mexico, made the same day that Nelly G. trotted in 2:30 at Nashville, makes it advisable to take note in this article of both performances) is about as richly bred a filly as can well be imagined, and in addition is by a developed sire who is also the first stallion to have a yearling 2:30 representative when only five years old himself. Leone is by Lancelot, the last foal of the never-to-be-forgotten Clay mare Green Mountain Maid, and is brother to seven trotters in the 2:30 list, in addition to all of which his dam produced Electioneer, the greatest trotting sire in the world; Storm, 2:26¾ and Miranda, 2:31. Bred as he is, it is no wonder that Lancelot's career from colthood was watched with interest, and when it was reported that as a three-year-old he had shown a trial in 2:31 the prospects for his becoming standard by performance right away were bright. But he did not start to beat the watch that season, and as a four-year-old was not shaped up for fast work. This season, however, after doing plenty of stud duty for a horse of his age, Lancelot was taken in hand by Blther with the result that a record of 2:27½ was obtained for him the second time he started. That his first foal should beat 2:30 so much as a yearling is gratifying in the extreme to those who pin their faith to such tested strains of blood as those comprising the pedigree of Lancelot. His brothers, Antonio and Mansfield, are getting early speed, and with Lancelot started in that line earlier than any of them there is assurance that the blood of Green Mountain Maid will breed on. Monon, sire of the dam of Leone, is also represented in the 2:30 list, as his son Monadel has a record of 2:18¾ recently.

Silicon, who has set the two-year-old race record at 2:15¾, is by the inbred Hambletonian stallion Wilton, 2:19¼, by George Wilkes, and her dam is by Hambrino, 2:21¼, son of Edward Everett, which horse was a son of Hambletonian, so that again there is in

Digitized by Google

a champion trotter two direct strains to the great progenitor of speed. By adding Moquette, 2:10, as a four-year-old, and Silicon to his list this season, Wilton has gone at one bound to a prominent position among the sons of George Wilkes. Silicon has been a great stake winner, her earnings footing up nearly if not quite $15,000, and if she improves as much as may reasonably be expected the 2:11¼ of Directum should have no terrors for her as a three-year-old.

The three-year-old race record for trotters is held by Directum, the time of his winning heats being 2:15, 2:12, 2:11¼. He is another Hambletonian in the male line, as his sire is Director, 2:17 (son of Dictator and Dolly by Mambrino Chief); dam by Venture, a son of Williamson's Belmont. This horse Venture unquestionably had a great deal of thoroughbred blood in his veins, but he was trotter enough to make a record of 2:27¼ a good many years ago.

The best four consecutive heats on record were contested by Little Albert and Jack, the last named winning the first in 2:12, a reduction of his record, while Little Albert took the next three in 2:10¾, 2:11¼, 2:10¾. Little Albert is by Albert W., 2:20, a son of Electioneer that is out of a mare by John Nelson, which latter horse came from the Trustee family of thoroughbreds. The dam of Little Albert was by a son of Seeley's American Star, so that in one way and another he has a good deal of the blood of the thoroughbred, and in view of his wonderful speed and gameness under most unfavorable circumstances it is only the part of fairness to attribute much of his merit in this respect to the strain of blood which produced the champion twenty-mile trotter of a generation ago.

Coming now to the two-mile performance of Nightingale we find it a grand one, as she stepped the distance in 4:33¼, an average of 2:16⅝ per mile, trotting the first mile in 2:18½, and the second, with a break, in 2:14¾. Way back in the days when Flora Temple was a queen of the trotting turf, it was common enough to find two-mile races on the program at trotting races, and in 1859 the little bob-tail mare set the record for that distance at 4:50½. This stood as the best in the books until 1872, when the pacers Defiance and Longfellow made a dead heat in 4:47¾. Then in 1880 some of the tracks in the grand circuit gave a purse for a two-mile race, and John Murphy brought out the gray gelding Steve Maxwell, that was good for a mile close to 2:20 in single harness, and with him lowered the two-mile record for trotters to 2:48½. In 1882 the stallion Monroe Chief, at that time in Budd Doble's stable and having a harness record of 2:18¼, which had been given him by Peter V. Johnston, started against the two-mile record of 4:48½ made by Steve Maxwell. Monroe Chief made his effort at the Lexington track and did the distance in 4:46. He held the honor for three years, but in 1885 Fanny Witherspoon, a daughter of Almont, whose harness record is 2:16¼, was prepared to go two miles against the record over the Washington Park track in this city. She was successful in lowering the record three seconds and entered the broodmare ranks with a two-mile performance of 4:43. No attempt to beat her two-mile record was made until Nightingale started at Nashville on October 22, and her great performance of 4:33¼ is likely to stand for some time because she is the first really high-class trotter that ever attempted a two-mile performance in recent days, and even with the aid of the bicycle sulky it is not every horse that can go two miles at an average of 2:16⅝. Nightingale's harness record is 2:10½, also made last week at Nashville, and it is possible that with another trial or two she would go two miles very close to 4:30. In any event she is a grand mare, and in point of record for one and two miles far outclasses anything that has thus far been produced. She is by Hamlin's Almont, 2:26, a son of Almont, and her dam was by Wood's Hambletonian, son of Alexander's Abdallah, and as Almont was also by Alexander's Abdallah, Nightingale has a double dose of Hambletonian blood in direct lines.

Notable Young Sires.

THE stallion Egotist, who is now seven years old, already has four representatives in the 2:30 trotting list, which is a greater number than has ever been placed to the credit of any other stallion of his age. Three of the quartette sired by Egotist that are in the list were the product of his season in the stud as a two-year-old. The result of that season was four colts, three of which are now standard by performance, while the other, although lame, can go in 2:35. This is certainly unassailable evidence as to the remarkable potency of Egotist, and the first thing noticeable about him is the fact that he has a record of 2:22½.

Digitized by Google

to his blood lines, he is by Electioneer and t of Sprite (a sister to Viking, 2:19¼, and ers), she being by Belmont, and out of aterwitch by Pilot Jr. Like their sire, the s of Electioneer are siring 2:30 and better eed with remarkable uniformity, but they ve the advantage of their progenitor in the t of being given opportunity in the stud at early age, whereas Electioneer was not ed to a great many mares until he was ten ars old. At the present time four of the ding sires of their respective ages, all ings considered, are Guy Wilkes, 2:15¼; ble Wilkes, 2:18 at three years; Axtell, 12 at three years, and Egotist, 2:22½. ree of these horses are members of the ilkes family, while the other represents the ood of Electioneer, but it will not escape atntion that each of them is provided with a st trotting record, which in these days is out the first thing looked for in a stallion anding for public service. It would idle to argue that stallions which not have fast records or that have not own the capacity to go well are necesrily incapable of siring speed, because two table instances to the contrary in Pilot edium and Lord Russell would at once conont the maker of such assertion. But even these cases it is the testimony of those who ould know best that the stallions named ould have had fast records but for accidents hich prevented their being trained. The ams of Pilot Medium and Lord Russell—ackey, 2:26, and Midnight—were daughters f Pilot Jr., and each of these sires is by a son f Hambletonian, so that in their principal lood lines they do not materially differ. The resent season has demonstrated that the comination of blood which produced Maud S, ill retain its potency for more than one genration, and when we find two as great sires s those mentioned tracing to Pilot Jr. in the aternal lines of their pedigrees, and are also onfronted by the fact that the second dam of gotist is a daughter of Pilot Jr., the evidence ccumulates that no better trot-producing train is to be found in a pedigree.

The Three-year-old Race Record.

DIRECTUM's race at the recent Nashville meeting was a record breaker. It was in a $6,000 stake for three-year-olds, and the pick of the country opposed him, the field numbering an even dozen. Kentucky Union was thought to be unbeatable, but she was never in it with Directum, although in the second and third heats she occupied second place at the finish, that honor in the first mile falling to Trevillian. But each heat was won by Directum as he liked, and the time was 2:15, 2:12, 2:11¼. That is the whole story of the race. It was California against the world, and the son of the developed sire Director, 2:17, fairly played with the previously unbeaten daughter of the undeveloped sire Aberdeen, and also with Trevillian, son of the undeveloped sire Young Jim. It was a great race, and from what Directum and Evangeline have accomplished this season they are clearly entitled to be called the champions of their respective ages, three and four years. To have a three-year-old take a race record of 2:11¼, and a four-year-old take a race record of 2:11¾, all in one season, is something that no horse save Director ever accomplished, and it proves that the little black son of Dictator will outbreed nearly every stallion in the land, when it comes to siring game and fast trotters that get to work early. Here is a sample of his work thus far:

Name.	*Record.*	*Age.*
Directum	2:11¼	3
Evangeline	2:11¾	4
Margaret S.	2:12½	4
Direct	2:18¼	4
Direct (p)	2:06	6
Guide	2:16¼	6

And in addition to having speed at an early age, the get of Direct are money winners and have become known as such. Margaret S., as a three-year-old, came from California to Cleveland to start in the rich *Spirit of the Times* stake, which she won, and now Directum is the crack three-year-old of 1892 and is pulling off a rich stake or purse about every week. Direct was also a good colt trotter—2:18¼ as a four-year-old was quite a clip three seasons ago—and then he took to pacing and showed himself, by a mile in 2:06, the fastest in the world at that gait. The get of Director take after their sire in more ways than one. A good many are colored like him, black; most of them have his bold and yet tireless gait, and they are pretty much all level-headed trotters like the little black whirlwind behind whom John Goldsmith used to sit with so much confidence about a decade ago. And in the case of the Directors nobody who knew their sire is surprised at their going well. Director was sired by a brother to Dexter, 2:17¼, and his dam was a great producing mare of the Mambrino Chief family. It was the combination

Digitized by Google

of these strains that made Director a great racehorse, and they are making him a great sire. He is a horse of marked individuality, great will-power, and almost human intelligence. John Goldsmith has told the writer that when Director was on the turf and trotting a hard race he would always take himself back about the time he reached the three-quarter pole, seemingly knowing that there would be a brush on the homestretch, and being just as well aware that he must have a little reserve speed and lung power for that crisis. It is the high intelligence of Director added to his great speed at the trot and his naturally pure gait, that have made him in some respects the greatest sire of the present day, and the sort of speed he gets will keep any horse in the front rank of public esteem. Mr. Salisbury once tried hard to make a great mistake when Director (then a colt), being taken sick on the journey to California, he telegraphed John Goldsmith to pitch him out of the car and let him die. Many a race, including the $10,000 stake at Hartford, did Director win for the gruff old Californian after that; but possibly Mr. Salisbury made another grand mistake last winter, when he sold Director, even at the reported price of $35,000, because if the black stallion keeps on getting such cracks as Direct, Evangeline, Margaret S. and Directum he will command a higher fee than any other horse in the country, and rightly, because it is speed combined with racehorse qualities that will bring the most money in the market. It is this combination that has made the Red Wilkes strain such a popular one, and it was the alleged lack of these qualities that caused the Electioneers to be neglected long after their superlative merits, in the way of speed, at an early age had caused them to become famous.

The Dash System.

THE dash-race system has been tried on several occasions this fall, notably at the Lexington meeting, where several events of that character were on the program, one of them being at a mile and an eighth for 2:14 horses, with $800 added. This was won by Honest George, who went the distance in 2:31¼, about a 2:15 clip, and the testimony of the newspapers represented at the Lexington meeting is that this and other dash events were thoroughly enjoyed by the crowd, although in one instance the judges considered that the favorite, Dandy, was not driven to win and declared everything off, putting a new driver behind Dandy, who then won rather handily. It is to be presumed that the gentlemen in the judges' stand at Lexington had good cause for their action, and yet, at the same time, it is rather a hardship on other horses in the race, and especially on the winner of a dash event, if, because of a break by the favorite, the entire affair is to be declared null and void and the defeated horse which carried the money given another chance and his backers allowed two opportunities to win the race, while those who had placed their money on other horses are really, under the circumstances, not afforded much field for action in this direction. It is unquestionably true that the dash system, especially where one horse is favorite against the field, furnishes excellent means for robbing that portion of the public which visits the betting ring, but this could be easily enough remedied were the same system of placing money in vogue on trotting tracks that obtains on the running turf. Book betting, where each horse must be backed separately, is the solution of the difficulty which confronted the judges at Lexington when Dandy was favorite over the field in the pool selling and had only to make a break in order to lose the money of those who had backed him and win that of the contingent which played against the favorite, whereas had the betting been conducted on the book system each horse would necessarily have been backed on his own merits and there would have been no opportunity to win money by causing the defeat of any one horse. It was long ago discovered on the running turf, where the dash system is universal, that it would not do to sell one horse in pools and bunch the others as a field against him, because men are more easily made dishonest when the temptation to make "sure" money is present. The dash idea is one, as was shown in a recent issue of the MONTHLY, that will force recognition from trotting associations until it is given a fair trial, and it will also be demanded by the public that pool selling on such events be abandoned and all the betting done through the medium of books.

Stamboul Holds the Record.

STAMBOUL, who at the close of the trotting season of 1890, was fighting for the championship among trotting stallions and whose mark of 2:11 was right in the front, has, after a year of retirement, been again placed in training,

Digitized by Google

with aid of the kite track and the bicycle y, with neither of which he was previously ainted, has, on each of the two occasions as started against his 2:11 mark, been suc- ful in lowering it, chopping off half a nd at the first attempt, and on the 27th of ober, at Stockton, Cal., doing a mile in ¾, which gives him the stallion champion- by quite a margin, and as Palo Alto, ¾, is dead, an added value is given the per- nance of Stamboul, it not being likely that horse now on the turf (with the exception Kremlin) has a chance to equal it. It is not essary to write at length of the blood lines achievements of Stamboul, as with the ex- tion of last season he has been before the lic since colthood, and always performed h credit. He carries more Hambletonian n any stallion with a very fast record, and horse of great beauty as well as speed. sire, Sultan, is a trotter with a record of 4, and his dam was a fast trotting daughter Hambletonian. Stamboul was a prominent -year-old trotter, and has steadily improved, il now he is at the top of the tree as to ords for stallions, although that he will g enjoy that distinction is doubtful. But an all-round stallion it would be difficult to d his equal, because in addition to his speed d breeding he is handsome as a picture, and, re important than all else in a stallion, he s speed, having a remarkably good show- g for a horse of his age. In fact on the day mboul lowered the stallion record to 2:08½ s two-year-old daughter Sweetwater took a cord of 2:26 over the same track, making two tters of that age by him that have entered e 2:30 list this season.

Columbia Driving Park Association Suspended.

President D. C. Beaman of the American otting Association has promptly suspended is track from membership in the American, d the suspension will remain in force ainst the association and grounds until all emiums won are settled, and stake money d entrance fees paid in races not started re- nded. The suspension follows the grounds gardless of lease or sale. The engagements this meeting were simply immense in umber and quality. Had the meeting been ficiently and honestly managed it would ave doubtless passed into history as one of e greatest meetings of this sensational year sensational performance.

Information gleaned from the associated press reports and from other sources show that a large sum of stake money was paid into the hands of the association by nominators and has disappeared. Checks given on the local bank were thrown out with the significant notation "no funds."

The explanation of President W. C. Jones that the money was spent for improvements on the grounds is no excuse at all. The stake money was paid in trust and should have been sacredly held as a trust fund. Neither Mr. Jones nor the association had any right to touch a dollar of it for any purpose, save in accordance with the published conditions of the stake.

It is to be hoped the laws of Tennessee are ample to punish a fraud of this character and that they will be rigidly enforced, not only as a punishment in this case, but in order that the example may serve as a warning to others in the future. This and other failures of like character of recent date, should, and doubtless will inaugurate a reform in "stake engagements" by the two parent associations.

The Index Digest.

The American Trotting Register Association takes pleasure in announcing to the breeders of the country and the students of the trotting horse of America, that it has had compiled an Index of all standard and non-standard horses registered in the first ten volumes of Wallace's American Trotting Register, giving the name and number of all stallions, name and number of sire, dam and sire of dam, with complete reference to the volume in which they are registered. Mares and geldings are treated in the same general comprehensive manner.

This work will prove a valuable addition to the volumes of the Register, without which no set is complete. To such persons as can not afford a complete set of the Register, but merely wish to ascertain whether an animal is registered, or only desire the initial part of the pedigree, it is invaluable. The compilers, The Mills Publishing Co., of Des Moines, Iowa, have done the work in an efficient and painstaking manner that is highly commended by the association, and will doubtless be duly appreciated by the public.

It is bound in uniform size and style with the Register, and will be sold for $7.50 postpaid.

Send New York or Chicago Exchange with

Digitized by Google

order, as the book is sold strictly for cash. Owing to the large cost of publishing and the small margin at which it is sold, the free list has been entirely suspended. Address The American Trotting Register Association, Lock Box, 4, Chicago, Ill., and orders will be promptly forwarded.

Notes and News.

THE following circular has just been issued:

CHICAGO, ILL., October 31, 1892.

Notice is hereby given that the next regular meeting of the board of appeals of the American Trotting Association will be held at the Victoria Hotel, Chicago, Tuesday, December 6, 1892, at 2 o'clock, P. M., for the transaction of such business as may be properly presented to the board for its consideration. All new applications and written evidence must be received at this office not later than November 15, 1892.

J. H. STEINER, *Secretary.*

THE Mills Publishing Company, of Des Moines, Iowa, have on sale, at regular prices, all the books and publications issued by the American Trotting Register Company.

DURING a recent pacing race in California, the contending horses in which were Plunkett and Dr. Swift—a couple of good ones by the way—the owl-like gentlemen who gazed dizzily at the world from the judges' stand, called up Lee Shaner, the driver of a mare called Lady Sidney that had been third all the time, and told him to drive for the next heat or he would be taken down. This was at the conclusion of the fourth mile, the first heat having been dead between Plunkett and Dr. Swift in 2:18, the second won by Plunkett in 2:13¾, the third by Dr. Swift in 2:14½ and the fourth by Plunkett in 2:15, the last named horse also winning the fifth and deciding heats in 2:13¼. When Shaner, who had been doing his best to keep in sight of the other two, was told by the judges that he was suspected of not driving to win, he replied that Lady H. was doing far better than he had ever expected her to, and rather reflected on the astuteness of the judges who couldn't tell when a pacer was doing its best. A similar instance happened at the old west side track in this city a good many years ago, it being the first season that the pacer Johnston was on the turf. He had won a number of races in Michigan, beating 2:20 all the time in slow pacing classes and absolutely playing with his fields from start to finish. In the Chicago race there was a great tip out on the Buffalo pacer Billy S., it being said that he could go a mile in 2:14, which in those days was a great clip. The only other starters aside from Johnston and Billy S. were Eddie D. and Gurgle. In the first heat Billy S. and Eddie D. made a break on the turn and seeing a chance to shut them out and thereby add to his winnings (the race being a stake) the driver of Johnston sent him a mile in 2:13, flagging the two that had broken, while Gurgle landed just inside the flag. She was driven by Andy McDowell, who was tickled almost to death to find her capable of keeping in sight of the money when a heat was paced in 2:13. His surprise therefore when before the second heat the judges called him up, told him they thought he was not driving the mare to win and admonished him to go on and beat Johnston, may be better imagined than described. The result was that the driver of Johnston, having already placed first, third and fourth moneys to his credit and won an extra $500 which the association had offered for beating 2:16, concluded that he might as well clean up the whole business by distancing Gurgle, which he did in the second heat, the time of which was 2:15. When the judges saw Gurgle coming up the home-stretch, having been driven to a standstill in her efforts to beat the flag, and realized that Johnston had gone the best race on record for the 2:30 class pacers of that day, they concluded that perhaps in warning McDowell to not pull Gurgle they had been engaged in a piece of work that was wholly superfluous.

THE sale of the Hobart stock has been fixed for December 21 and 22, in New York city. The consignment numbers about seventy head, of which more than thirty are broodmares. The first animal to be sold is Stamboul 2:10¼.

BLACKSTONE, for many years the favorite saddle horse of the late Samuel J. Tilden, died recently of old age.

THE first colt by the stallion Fred Arthur, pacing record 2:13¼, that has been broken to harness, won the yearling race for pacers at the Terre Haute, Ind., fair, obtaining a half-mile record of 1:23½ the fourth heat, stepping the last quarter at a 2:26 gait. Fred Arthur, a Woodburn-bred stallion, was a trotter as well as a pacer when on the turf, and made a trotting record of about 2:31 before he was allowed to pace.

Digitized by Google

WE have been requested repeatedly to publish a table showing the distance covered per second by a horse when going at speeds varying from a 2:00 to a 2:30 gait. The following is believed to be a substantially correct compilation of the figures desired:

RATE OF SPEED.	Distance Per Second.	
	Feet.	Inch's
2:30	35	2
2:25	36	5
2:24	36	8
2:23	36	11
2:22	37	2
2:21	37	5
2:20	37	8
2:19	38	..
2:18	38	3
2:17	38	6
2:16	38	9
2:15	39	..
2:14	39	4
2:13	39	8
2:12	40	..
2:10	40	7
2:08¾	41	.
2:08	41	3
2:05	42	3
2:04	42	7
2:00	44	..

It will be noticed that in the distance covered by the horse when going at a rate of speed of from 2:30 to 2:20 there is an approximate increase of three inches per second for each additional second's lowering of the speed rate, while in the speed rate between 2:10 and 2:00 the increase amounts to four and one-tenth inches per second. A horse going a mile in two minutes would distance Martha Wilkes, Palo Alto and Maud S. and have something to spare, and would leave Nancy Hanks and Mascot, the fleetest of the present day, about seven lengths to the rear.—*Clark's Horse Review.*

AFTER years of faithful service the well-known trotting sire, Fisk's Masterlode, a son of Hambletonian 10, was, after becoming impotent, sold by the owner, for whom he had made a fortune. He was sold, traded or given away to parties living in Hartford township, Van Buren county, Mich., where he was knocked about for over a year, doing hard work without a particle of grain, not even a bed of any kind except the earth; no brush to rub his weary bones that were once covered by the best of blankets; no caressing hand, but only the merciless whip. It was in this starved and neglected condition that one of Bangor's horsemen, Lewis Harmon, found Masterlode on September 10 last. When Harmon beheld the old horse, whom he had seen many times in the prime of life, his eyes filled with tears. He then purchased the horse for the paltry sum of $5 and took him to his home in Bangor, where he gave him some good oats, a bed of clean straw, and cared for the old horse until the faithful animal died, in the latter part of October. Horse lovers should remember the name of Lewis Harmon.

A KENTUCKIAN who evidently knows what he is writing about says: "The taste for a real saddle is vitiated by a class of "professors" from England and Germany who conduct riding schools in the eastern cities. They know nothing of the delights of horseback riding proper. They have, perhaps, never mounted a saddle horse of the western type, and therefore make the most of what they know about the saddle horse. There is another reason for their adoption of the high-trotting horse in their schools. Many of the eastern riders are driven to horseback exercise as a relief from the ills of counting-houses. They are in search of liver-stirring exercise, hence they expect to find it in a high-stepping trot. They are poor, misguided creatures, and will find in the end that the ease of body and mind given by a morning ride on a pure-gaited saddle horse will prove more beneficial than the violent jolting of vitals they get on the back of the new-school horse."

AN extraordinary case bearing upon the export of horses has just been decided in the London Central Criminal court, four persons having been charged with conspiracy to obtain by false pretenses large sums of money from the British and Foreign Marine Insurance Company (Limited) and divers other insurance companies and insurers, while some of them were further charged with maliciously killing horses on the high seas, says a foreign exchange. Briefly stated, the allegations against the prisoners were that they conspired to insure a number of horses in amounts greatly in excess of their value prior to sending them to the Cape, and that subsequently, whilst at sea, some of the accused administered strychnine to the animals in sufficient quantities to kill them, upon which the insurances were claimed. Eventually the British and Foreign Marine Insurance Company became suspicious and sent an agent on one of the voyages, with the result that when the horses died he made a post-mortem examination of the bodies and discovered the presence of strychnine in considerable quantities. In the result, the jury found all the prisoners guilty of conspiracy to

Digitized by Google

defraud, and two of them were sentenced to twelve months' imprisonment with hard labor and to pay a fine of £250 each, the other two being sentenced to three months' imprisonment. The charge of killing the horses was adjourned until next session.

THE bay horse Neponset, that secured a record of 2:24¼ at one of the Western meetings a few days ago, brings the blood of that famous old mare Sally Chorister to the front again. Sally Chorister herself produced Proteine, 2:18; Belle Brasfield, 2:20; and Belle Patchen, 2:30¾. Belle Brasfield produced Holstein, 2:29¾. Belle Patchen produced Baron Wilkes, 2:18, and another daughter, Admiration by Administrator, produced Ada, 2:28¼. Belle Patchen was bred to Governor Sprague, 2:20½, and produced a filly called Maud S. T., and that filly, bred to Nutwood, produced Neponset, 2:24¼. Baron Wilkes is also siring extreme and uniform speed, so that the female line from Sally Chorister is a most remarkable one. The old mare produced one son, Homer by Mambrino Patchen, that is represented by two fast performers, and his daughters are producing extremely well. The value of the blood of such a mare as Sally Chorister is pretty well understood nowadays, as is demonstrated when descendants of the great producers are offered for sale.—*The Horse World.*

Not An Experiment.

MILLIONS of dollars' worth of Domestic Animals and Poultry are every year lost or sacrificed, because owners are not acquainted with their diseases, and do not know how to treat them. Yet sick animals under DR. HUMPHREYS' VETERINARY SPECIFIC SYSTEM are more readily treated and cured than people. The greatest blessing of modern times for Domestic Animals is their treatment, when sick, by this system. That they are daily so cured in thousands of instances, is as true as that the people ride on railroads, sew with sewing machines, or send messages by telegraph. These SPECIFICS ARE NOT AN EXPERIMENT. They have been in use among FARMERS, BREEDERS, LIVERY STABLE and TURFMEN, HORSE RAILROAD, EXPRESS, MINING and MANUFACTURING COMPANIES, MENAGERIES and HIPPODROMES, and others handling large numbers for horses and other stock, with complete success for twenty-five years. Manual free.

Questions and Replies.

C. A. C., SANTA ANA, CAL.—Are the following horses registered? 1. Silverthreads, son of The Moor. 2. Morgan Rattler (California). 3. Harvester, by Sultan, dam Harvest Queen, 2:29½.

ANSWER.—1. Yes, his number is 18653. 2. No. 3. He is registered as Star Sultan 12036.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal.* The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ALFURO 20608, (6) b h foaled 1890; by Alpha Bell 10941; dam Nora C., by O. A. C. 2072; g d Kate Rysdyke, by John E. Rysdyke 5721, etc. [See Nora C., Vol. VIII.] Bred by Charles E. Bateman, Longwood, Ont., Can. [Vol. XII.]

ALINGTON 20762, (6) bl h foaled 1892: by Axtell 5183; dam Diploma, by Monon 4071; g d Luella, by Hero of Thorndale 549, etc. [See Diploma, Vol. VII.] Bred by F. S. Gorton, Chicago, Ill. [Vol. XII.]

ANAMOSA MAID, (9) br m foaled 1876: by Comet 5965; dam not traced. Bred in Linn county, Iowa, by John Hill, Greeley, Neb.; foaled the property of John Delancy, Prairieburg, Iowa; passed to P. Washington, then to George Watters, then to Watters Bros., Anamosa, Iowa; then to M. Hicks & Co., Holyoke, Mass.; then to Henry Burk, Rockville, Conn. Record 2:33½. [Vol. XII.]

ASHWOOD BOY 20607, (6) b h foaled 1892; by Wilkesbarre 5244; dam Cassia Wilkes, by Favorite Wilkes 3257; g d Lucy Dingman, by Hailstorm 813, etc. [See Cassia Wilkes, Vol. VI.] Bred by Charles E. Bateman, Longwood, Ont., Can. [Vol. XII.]

BONNIE ALICE, (7) bl m foaled 1891; by Bonnie W. 11932; dam Alice, by Flying Cloud 134; g d Jenny, by Bellfounder (Smith's). Bred by John Wren, Springfield, Ohio. [Vol. XII.]

APPENDIX TO TROTTING REGISTER.

ANIMALS NOT STANDARD.

NOTE.—Copies of pedigrees from the non-standard department of any volume of the Register will be published here on the same conditions as stated at the head of "Standard Animals." Under the current rules, the following are eligible to entry in the Register as non-standard: 1. Mares, fillies and geldings by standard horses. 2. Animals that are historical and worthy of preservation. Stallion colts can not now be registered unless they possess two standard crosses.

LA BELLE M., b m foaled 1888; by Hyperion 1916; dam not traced. Bred by Lycurgus Nelson, Murfreesboro, Tenn.; passed to B. T. Millican; then to William Rahe; then to David Johnson, Madison, Ind. [Vol. XII.]
